# Conventions and Acronyms

## Conventions

In this section, describe useful notes and important things audience should know as follows.

---

**NOTE**

Useful notes.

---

**CAUTION**

Important things

---

## Acronyms

Acronym	Description
Abuse Use Case	Deliberate abuse of functional use cases in order to yield unintended results.
Accountability	The property that ensures that the actions of an entity may be traced uniquely to that entity.
Actor (Threat Agent)	Person who originates attacks, either with malice or by accident, taking advantage of vulnerabilities to create loss.
Application Programming Interface (API)	A source code interface that a computer system or program library provides to support requests for services to be made of it by a computer program [PCI HSM Security Req].
Asset	An asset is a resource of value. It varies by perspective. To a business, an asset might be the availability of information, or the information itself, such as customer data. It might be intangible, such as a company's reputation.
Attack (Exploit)	An attack is an action taken that utilizes one or more vulnerabilities to realize a threat.
Attack Surface	Logical area (browser stack, infrastructure components, etc.) or physical area (hotel kiosk) that an attack may occur or originate from.
Attack Vector	Point and channel for which attacks travel over (card reader, form fields, network proxy, client browser, etc.).
Authenticity	The property of being genuine and being able to be verified and trusted; confidence in the validity of a transmission, a message, or message originator [NIST SP 800-137, CNSSI 4009].
Authentication	The process of determining whether someone or something is, in fact, who or what it is declared to be "http://whatis.techtarget.com"
Authorization	The official management decision given by a senior organizational official to authorize operation of an information system and to explicitly accept the risk to organizational operations (including mission, functions, image, or reputation), organizational assets, individuals, other organizations, and the nation based on the implementation of an agreed-upon set of security controls [NIST SP 800-137, CNSSI 4009].
Availability	Ensuring timely and reliable access to and use of information [NIST SP 800-137, 44 U.S.C., Sec. 3542]. Capability of a product to provide a stated function if demanded, under given conditions over its defined lifetime [ISO 26262-1].
Confidentiality	Preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information [NIST SP 800-137, 44 U.S.C., Sec. 3542].

Countermeasures (Control)	Countermeasures address vulnerabilities to reduce the probability of attacks or the impacts of threats. They do not directly address threats; instead they address the factors that define the threats.
Impact	Value of damage possibly sustained via an attack.
Integrity	Guarding against improper information modification or destruction and includes ensuring information non-repudiation and authenticity [NIST SP 800-137, 44 U.S.C., Sec. 3542].
Multi-tenant	An architecture in which a single computing resource is shared but logically isolated to serve multiple consumers [NIST.SP.500-322].
Non-repudiation	The ability to provide proof of the integrity and origin of data.
Privacy	The ability to provide protection against personal data discovery and misuse of that information by other users [Common Criteria Part 2].
Possession and/or control	the system and associated processes shall be designed, implemented, operated and maintained so as to prevent unauthorized control, manipulation or interference
Randomness	A random bit sequence could be interpreted as the result of the flips of an unbiased “fair” coin with sides that are labeled “0” and “1,” with each flip having a probability of exactly $\frac{1}{2}$ of producing a “0” or “1.” Furthermore, the flips are independent of each other: the result of any previous coin flip does not affect future coin flips. The unbiased “fair” coin is thus the perfect random bit stream generator, since the “0” and “1” values will be randomly distributed (and $[0,1]$ uniformly distributed). All elements of the sequence are generated independently of each other, and the value of the next element in the sequence cannot be predicted, regardless of how many elements have already been produced [NIST 800-22].
Safety	The design, implementation, operation and maintenance of the system and associated processes shall not jeopardize the health and safety of individuals, the environment or any associated assets. Absence of unreasonable risk due to hazards caused by malfunctioning behavior of E/E systems [ISO 26262-1].
Spoof	The term is used to describe a variety of ways in which hardware and software can be fooled. IP spoofing, for example, involves trickery that makes a message appear as if it came from an authorized IP address.
Tampering	The ability to change data in transit or in a data store.
Threat	A threat is an undesired event. A potential occurrence often best described as an effect that might damage or compromise an asset or objective. It is

	relative to each site, industry, company and is more difficult to uniformly define.
Trasnport Layer Security (TLS)	Transport Layer Security (TLS) is a cryptographic protocol designed to provide communications security over a computer network. The protocol is widely used in applications such as email, instant messaging, and voice over IP, but its use in securing HTTPS remains the most publicly visible.
Secure Socket Layer(SSL)	Netscape's Secure Socket Layer protocol [SSL3]. TLS is based on SSL Version 3.0. [RFC5246]

4.1	<b>Analysis Criteria .....</b>	54
4.1.1	Security Properties .....	54
4.1.2	Approach (What we did to find the vulnerability).....	54
4.1.3	Attack vector (pathway, what attacker obtained) .....	54
4.1.4	Exploit Techniques .....	54
4.2	<b>Vulnerability Analysis.....</b>	55
4.2.1	Vulnerability List.....	55
4.2.2	Recommended Mitigations.....	55
4.2.3	V01 - UI Webapp in client side send user credential as raw string, not encrypted .....	56
4.2.4	V02 - Privacy is exposed in vehicle registration information .....	58
4.2.5	V03 - User credentials are exposed to URL params due to using the 'GET' method. .....	60

4.2.6	V04 - Attacker can disable playback input operation of client's Server.js .....	61
4.2.7	V05 - User credentials(username, password, otp) are exposed when using the debug tool such as chrome inspector.....	63
4.2.8	V06 - Token is exposed when using the debug tool such as chrome inspector or client console log	64
4.2.9	V07 - Username is exposed in the decoded token information. ....	66
4.2.10	V08 - Attacker can inject a fake play-back to officer's browser .....	67
4.2.11	V09 - All Username were exposed when entering a specific page .....	68
4.2.12	V10 - All OTP seeds were exposed when entering a specific page. ....	70
4.2.13	V11 - The administrator account has been hijacked and can login with the admin` s credentials(username, password, otp). .....	72
4.2.14	V12 - Any user account can be added by obtaining administrator privileges.....	74
4.2.15	V13 - Direct access to "https://team-server-dhzve.run.goorm.io/admin/signup" page is possible through the exposed admin cookie value.....	76
4.2.16	V14 - no log records for login or logout with an administrator account and looking up log on the server side.....	78
4.2.17	V15 - An attacker can retrieve plate information with a newly added user account by the stolen administrator account .....	79
4.2.18	V16 - jwt token spoofed by an attacker .....	81
4.2.19	V17 - Vulnerability of recovering user password .....	83
4.2.20	V18 - An attacker can retrieve plate information with a stolen jwt token. ....	84
4.2.21	V19 - There is no JWT token revoke mechanism .....	86
4.2.22	V20 - Actual account(test@gmail.com) is entered as an example in the Email Address field..	89
4.2.23	V21 - no log records for login with a general account on the server side.....	91
4.2.24	V22 - Remote server spoofing .....	92
4.2.25	V23 - phishing client web site.....	95
4.2.26	V24 - Stolen token, spoofing as valid user, sensitive information could be sniffed .....	97
4.2.27	V25 - The external server provided by goorm does not support mutual authentication using tls based on pki.....	99
4.2.28	V26 - Available to change https to http by tempering the client's server.js file.....	100
4.2.29	V27 - A TOCTOU attack is possible because there is a time gap between file selection and file playback.	102

## **5 Lessons Learned..... 105**

# 1 Automatic License Plate Recognition (ALPR) System

---

## 1.1 Introduction of Automatic License Plate Recognition (ALPR) System

The Automatic License Plate Recognition (ALPR) System is an integrated solution of servers that provide license plate database lookups and remote camera applications designed to support law enforcement.

Our system consists of an application and a server operating in a Windows environment and provides easy license plate recognition and database inquiry using a remote camera to provide a quick and accurate vehicle inquiry service to police officers.

## 1.2 Team S4Best Role and Responsibility

Table 1 Team member Role and Responsibilities

Member	Role	Responsibility
Namseok Kim	Team Leader	Project Management
		DevOps
		Static Analysis
Seongeun Kim	System And Software Architect	Architecture Design
		Server Development
		Design Review
Choongrae Kim	Security Architect	Security Architecture Design
		Secure Communication Development
		Design Review
Jiwoong Eom	Server Engineer/Developer	Authentication & Database Development
		Risk Analysis
		Exploit Vulnerability
Jeongho Choi	Client Engineer/Developer	Authentication Development
		Threat Analysis
		Risk Assessment
Jaeggeun Lee	Core Engineer/Developer	Core Engineering
		Client Development
		Exploit Vulnerability

## 2 Schedule

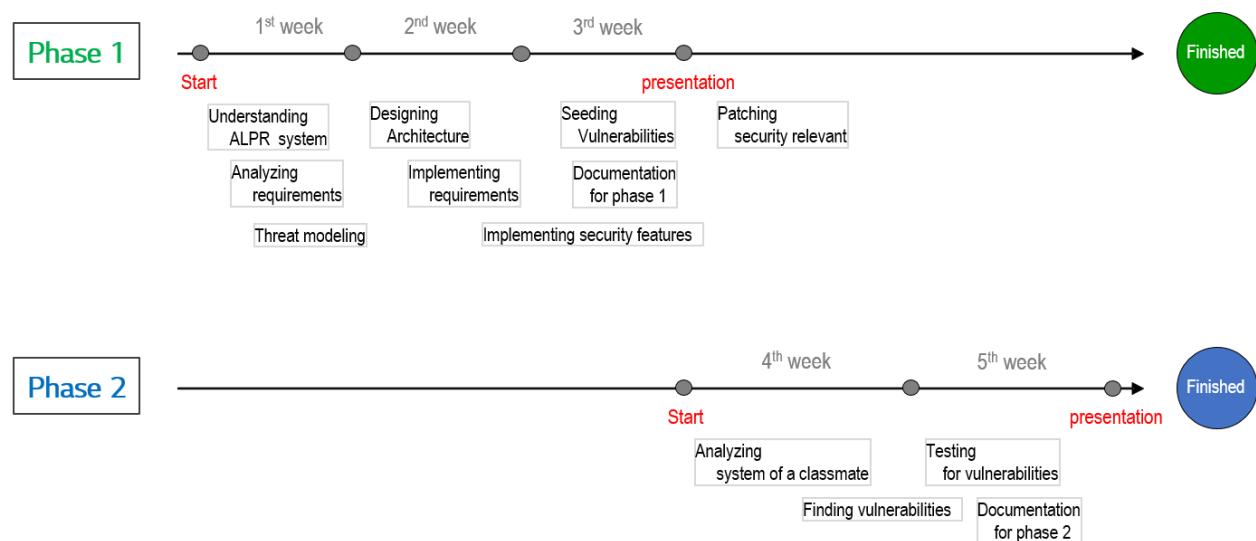

Figure 1 Plans and Schedule

# **Phase 1 : Secure Development**

# 1 Requirement Engineering

---

## 1.1 Client – Functional Requirements

Table 2 Client - Functional Requirements

ID	Statement
REQ_CLI_FUNC_001	The system shall allow an officer to access the ALPR system through a secure web interface
REQ_CLI_FUNC_002	The system shall allow an officer to login and authenticate users locally and to the backend license plate database lookup. The system must use two factor authentication for sign on and user credentials must be protected.
REQ_CLI_FUNC_003	The system should allow a law enforcement officer to select and save retrieved information locally.
REQ_CLI_FUNC_004	The system should allow a law enforcement officer to send retrieved information to a mobile device, such as a mobile phone to use in the field.
REQ_CLI_FUNC_005	The system should read images from the vehicle camera or a playback file and identify license plates for evaluation.
REQ_CLI_FUNC_006	The system should perform the ALPR function in real-time while maintaining a frame rate of at least 25fps.
REQ_CLI_FUNC_007	The system should query the backend license plate server for details about the vehicle. The user must be alerted for vehicles that are stolen, the owner is wanted (criminal), or if it is a vehicle of interest (expired registration, unpaid tickets, owner is missing). Alerts must contain reason and vehicle make, model and color along with the isolated plate image and the recognized license plate number for operator comparison.
REQ_CLI_FUNC_008	If a license plate does not generate an alert, then the user interface must display the last recognized plate image, the recognized license plate number and vehicle make, model and color so the operator can visually check if the plate matches the vehicle if desired.
REQ_CLI_FUNC_009	The system should provide an area in the user interface that always contains the current camera /playback view.
REQ_CLI_FUNC_010	The system should allow officers to configure computed camera / playback frames per second, average time per frame, jitter and frame number.
REQ_CLI_FUNC_011	The system should allow the officer to choose between using a live camera and playback file in the UI.
REQ_CLI_FUNC_012	The system should alert officers of any communication errors or failures.

## 1.2 Client – Non-Functional Requirements

Table 3 Client - Non-Functional Requirements

ID	Statement
REQ_CLI_NON_001	Lost or compromised credentials must be handled in a reasonable way.
REQ_CLI_NON_002	The system should provide secure communication between the client application and to the backend license plate database lookup system.
REQ_CLI_NON_003	The ability to detect network connectivity issues with the backend server within 5 seconds and automatically resolve the communication issue if possible.
REQ_CLI_NON_004	The system must fetch vehicle information in no more than 10 seconds as officers are often making queries in real time.

## 1.3 Server – Functional Requirements

Table 4 Server - Functional Requirements

ID	Statement
REQ_SVR_FUNC_001	Support license plate queries.
REQ_SVR_FUNC_002	Authenticate remote laptop users.
REQ_SVR_FUNC_003	Support multiple users.
REQ_SVR_FUNC_004	Return the best match license plate if there is not an exact match that includes a configurable minimum confidence threshold to support a partial match.
REQ_SVR_FUNC_005	Track the average number of queries per second for each user and overall queries per second, for all users.
REQ_SVR_FUNC_006	Track the number partial matches and no matches for each user and all users
REQ_SVR_FUNC_007	Support configurable values via a configuration file.

## 1.4 Client – Non-Functional Requirements

Table 5 Client - Functional Requirements

ID	Statement
REQ_SVR_NON_001	Ensure secure communication with the client applications.

# 2 Security Goals

---

## 2.1 Business Goal

The system allows authorized users to make decisions based on the information provided by the image recognition system.

Earn our customer's trust.

## 2.2 Security Goals

Table 6 Security Goals

ID	Statement
G-01	Encrypts Sensitive Information
G-02	Provides Authentication
G-03	Provides integrity of sensitive data

# 3 Preliminary System Architecture

This section provide overall system description and strategy for ALPR system.

## 3.1 Preliminary System Architecture and Item boundary

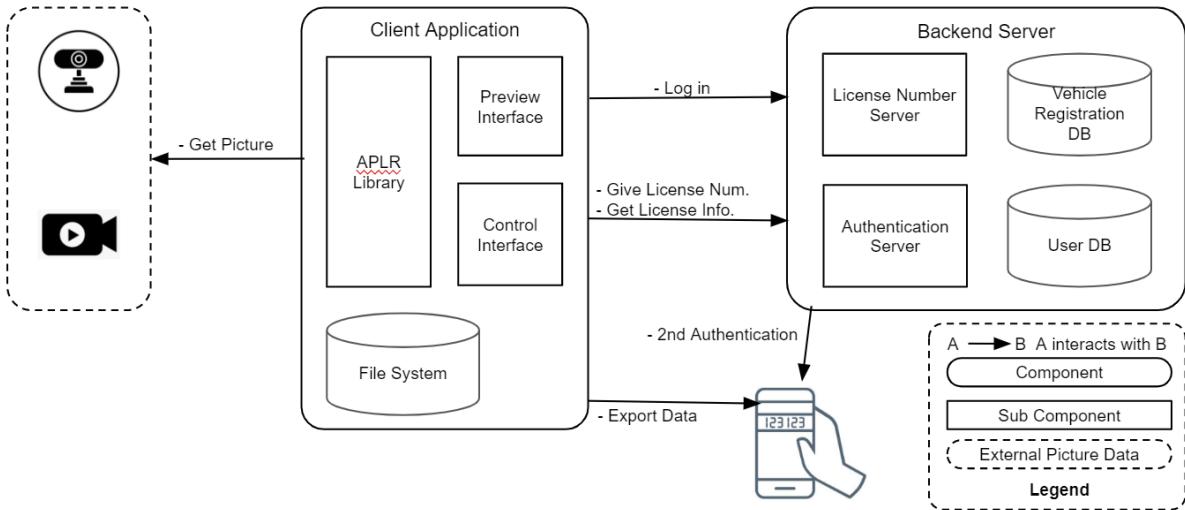

Figure 2 Preliminary System Architecture

## 3.2 System Architecture Element

Table 7 ALPR System Definition

	Client Application	Backend Server	Mobile Phone	External Picture Data
HW	x86 Base PC	x86 Base PC	NA	NA
Interface	WiFi, Cloud	WiFi, Cloud	WiFi, Cloud	USB, Block IO
OS	Windows 10	Windows 10	Android	NA
SW Module	APLR Lib., Frame Image Interface, Control Interface, File System	License Number Server, Vehicle Registration DB, Authentication Server, User DB	2nd Authentication Application, Vehicle Information Viewer	Live Camera, Playback
Data	User ID, PW Officer authentication result Image of vehicles on the road Image Frame Information	User ID, PW Two Factor Authentication Information Officer authentication result Vehicle license number	Two Factor Authentication Information Vehicle information corresponding to license number	Image of vehicles on the road

	(FPS, Average Time per Frame, Frame Number, Jitter) Vehicle license number Vehicle information corresponding to license number	Vehicle information corresponding to license number		
--	--	---	--	--

**Table 8 ALPR System Definition**

Component	Sub Component	Description
External Picture Data	Live Camera	Video frame image transmitted in real time through the camera
	Play-Back	Video frame image obtained from saved video file
Client Application	APLR Library	Recognizes the license plate area from a specific frame image and extracts the license number
	Preview Interface	Outputs frame images and corresponding frame information (FPS, Average Time per Frame, Frame Number, Jitter)
	Control Interface	Proceeds with officer's certification process for client application Sets operation mode of application(frame input selection) Outputs license information of cars
	File System	Saves license information obtained from backend server
Backend Server	License Number Server	Search and retrieve the vehicle information corresponding to license number delivered from client application from DB, and send those to client application again.
	Authentication Server	Proceed with user authentication using the two factor authentication with the user ID/PW delivered from client application.
	Vehicle Registration DB	Stores various vehicle information for each vehicle license number. The field of the saved record follows the predefined form in the assignment introduction.
	User DB	Stores officer's user credential, such as ID, PW, account recovery hint, etc. which are corresponding to each officer.
Mobile Phone	2nd Authentication App.	Mobile application for two factor authentication
	Vehicle Information Viewer	Mobile application for saving and checking vehicle information delivered from client application.

### 3.3 Operation Scenario

#### APLR Scenario

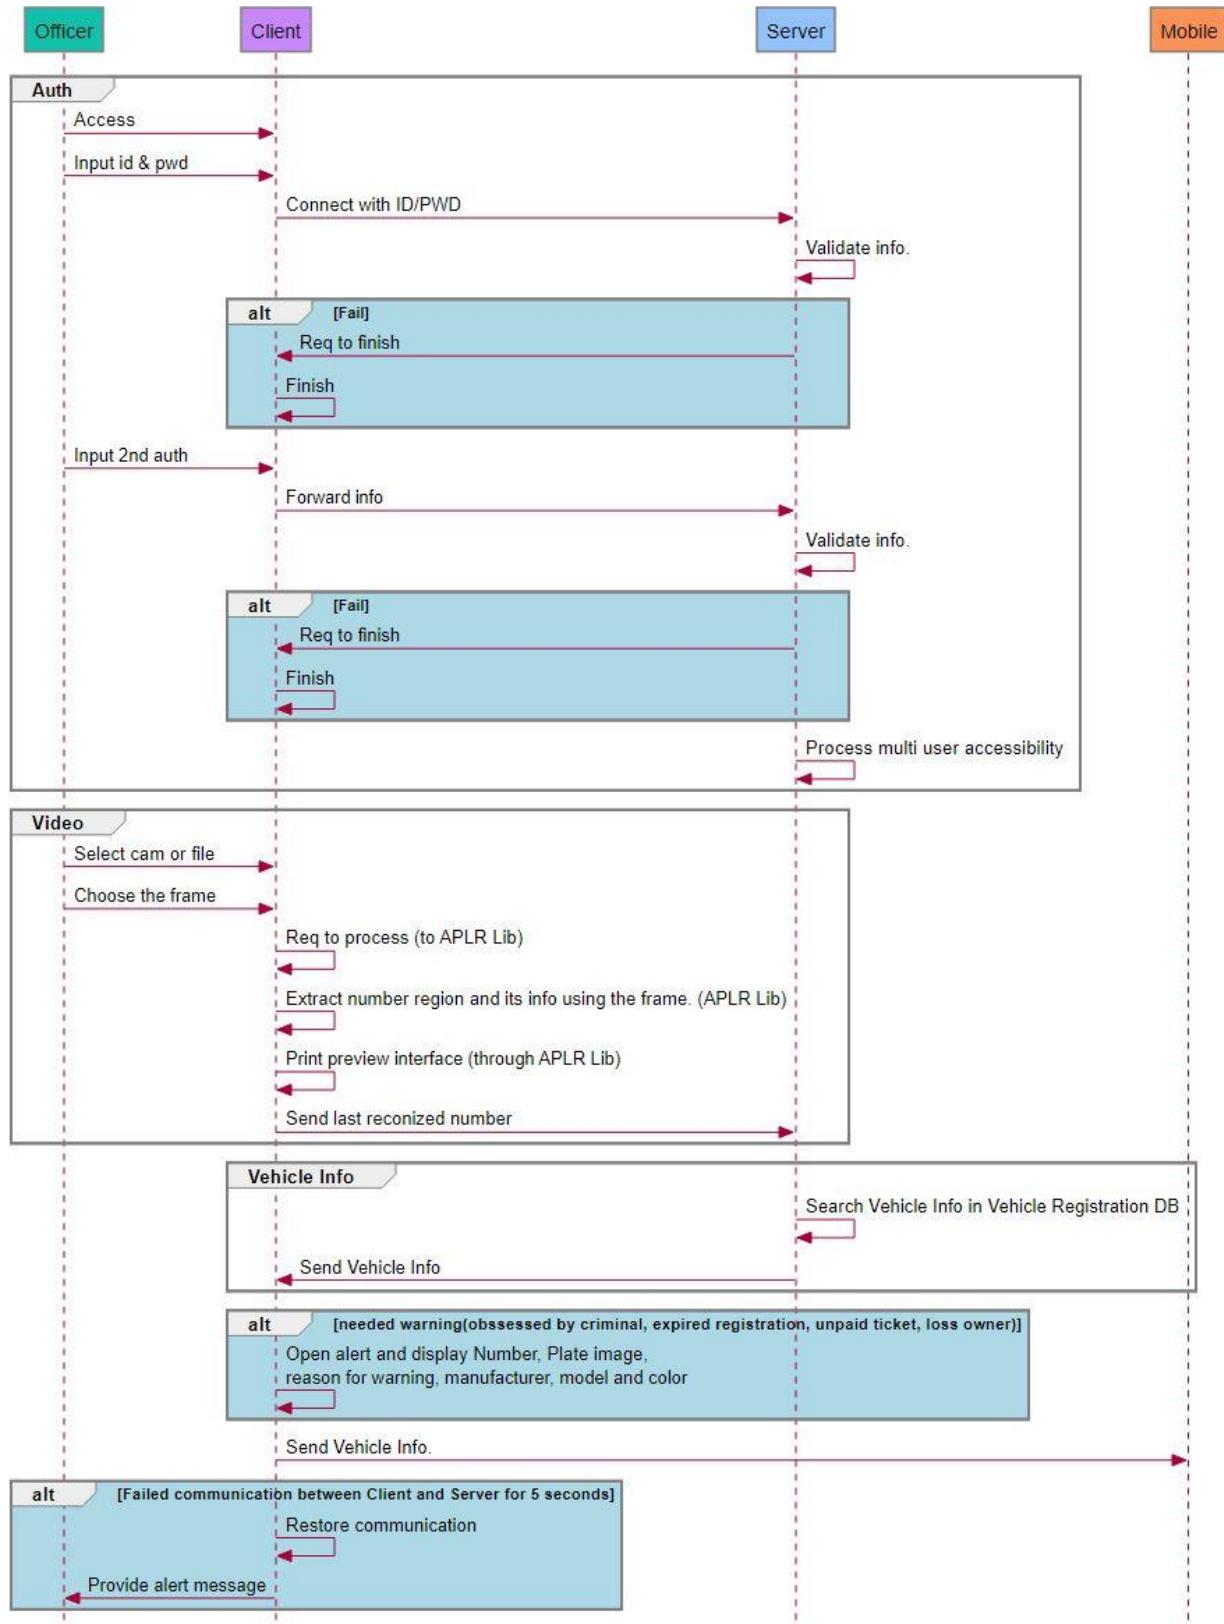

Figure 3 ALPR Operation Scenario

## 1. Client Application Execution and Connection to Server

1.1 The officer runs the client application and connects to the backend server by entering the user ID and password.

1.2 Backend server performs additional verification using two factor authentication infrastructure after validating user ID and password delivered from client application.

1.3 When the validation of step 1.1 and 1.2 is completed, the validation result is delivered to the client application.

1.4 If the result of user verification in step 1.3 is valid, proceed to step 2.1. If it is not valid, the application is terminated.

## 2. Selection of image of vehicles on the road in client application

2.1 The officer selects one of live camera and playback file as input of image of vehicles on the road.

2.2 Select the frame in the mode selected in step 2.1 as the input of the ALPR Library and proceed with the image recognition process.

## 3. License number recognition using APLR library

3.1 Extracts the area of the license plate and the license number inside area by using the frame selected in step 2.1 as input.

3.2 Extracts the frame information being processed and outputs it at the bottom of the preview interface.

3.3 Send the last recognized number to backend server

## 4. Search vehicle information in backend server

4.1 Backend server retrieves the vehicle information corresponding to the number delivered in step 3.3 from vehicle registration DB and delivers it to the client application.

4.2 Step 3.3 and 4.1 should be done within 10 seconds.

## 5. Alert output of client application

5.1 Alert is displayed when a warning is found in the vehicle information delivered in step 4.1.

Alert displays the vehicle number and license plate image, as well as the reason for the warning, make, model, and vehicle color.

5.2 The reasons for the warning in step 5.1 include theft and criminal possession, deregistration, unpaid tickets, and missing owner.

## 6. Storing vehicle information and forwarding to mobile phone in client application

6.1 The vehicle information delivered in step 4.1 is collected by the client application and delivered to the mobile phone if necessary.

## 7. Exception handling when communication fails

7.1 Client application should recover communication problem if communication with backend server fails for 5 seconds.

7.2 The proper alert should be provided to user if a communication problem occurs.

## 8. Backend server facilities

8.1 Multiple officers physically separated can be connected to backend server.

8.2 The average and total number of queries per second are stored for individual officers and all users, respectively.

8.3 Use the configuration file to set the server operation.

### 3.4 Assumptions

Table 9 Assumption list

Assumptions No.	Description
001	User Credentials such as ID/PW/OTP Seed Key are included in the server DB.
002	ACL is applied to User Credential DB and DB Keeper (statement) is applied.
003	Cryptographic Key (Sym/Asym) is stored in a reliable and secure device. ex) HSM.
004	OTP Seed Key for each user is created when creating an account and is ported to a unique OTP device for each user.
005	OTP device is owned exclusively by each user like a banking system.

# 4 Threat Modeling

## 4.1 STRIDE.

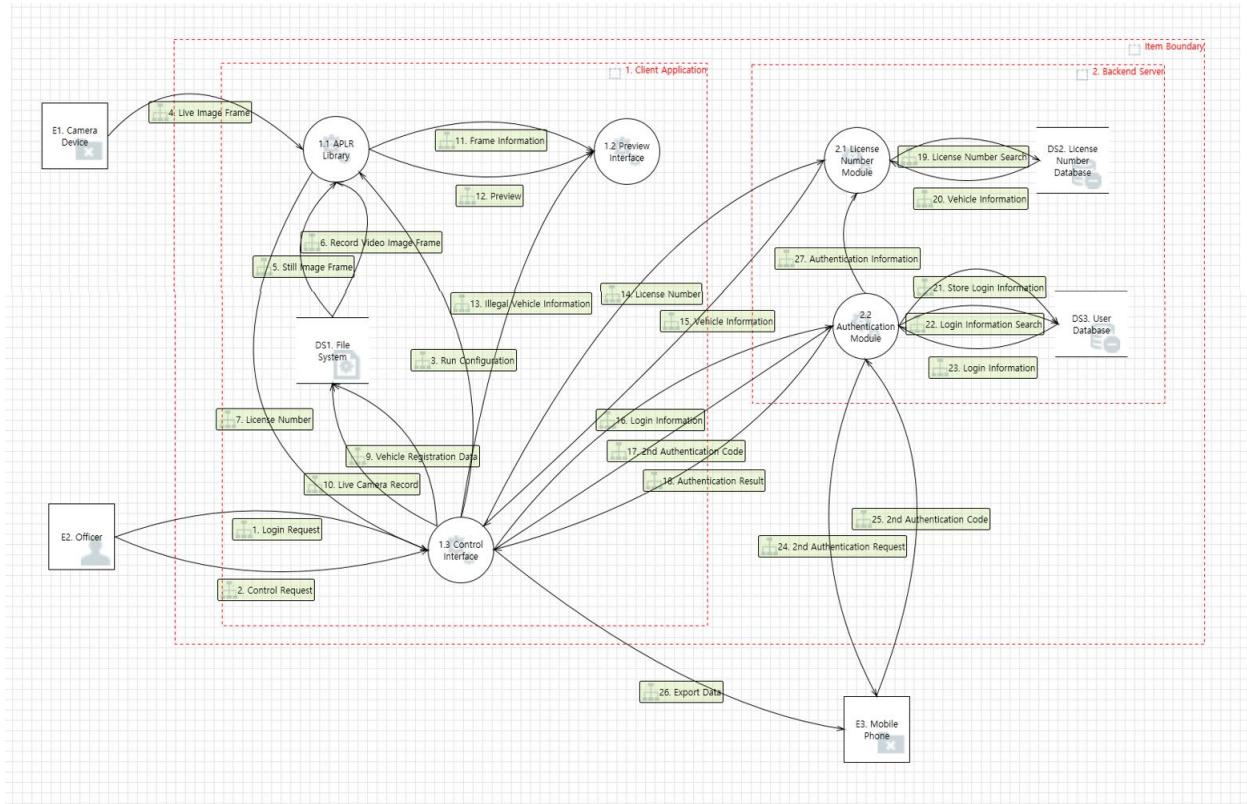

Figure 4 Data Flow Diagram

## 4.2 OWASP Risk Assessment

### 4.2.1 Risk Rating

Table 10 Risk Rating

Overall Risk Severity = Likelihood x Impact				
Impact	HIGH	Medium	High	Critical
	MEDIUM	Low	Medium	High
	LOW	Note	Low	Medium
		LOW	MEDIUM	HIGH
	Likelihood			
Likelihood and Impact Levels				
0 to <3		LOW		
3 to <6		MEDIUM		
6 to 9		HIGH		

## 4.2.2 Server Threat List

**Table 11 Server Threat 001**

Interface	Threat Group	Factors for Estimating Likelihood					Factors for Estimating Impact					Overall Risk Severity
		Estimating Factors	Factors	Range	Likelihood		Estimating Factors	Factors	Range	Impact		
19. License Number Search	DS2. License Number Database may be spoofed by an attacker and this may lead to data being written to the attacker's target instead of DS2. License Number Database. Consider using a standard authentication mechanism to identify the destination data store.		Skill level	3 - Network and programming skills	5.125	MEDIUM	Technical Impact	Loss of confidentiality	5 - Extensive critical data disclosed	6.5	HIGH	High
	Threat Agent	Motive	6 -	Loss of integrity				9 - All data totally corrupt				
		Opportunity	7 - Some access or resources required	Loss of availability				7 - Extensive primary services interrupted				
		Group Size	6 - Authenticated users	Loss of accountability				9 - Completely anonymous				
	Vulnerability	Ease of discovery	3 - Difficult	Business Impact			Financial damage	3 - Minor effect on annual profit				
		Ease of exploit	3 - Difficult				Reputation damage	9 - Brand damage				
		Awareness	4 - Hidden				Non-compliance	5 - Clear violation

			Awareness	9 - Public knowledge				Non-compliance	5 - Clear violation			
			Intrusion detection	8 - Logged without review				Privacy violation	5 - Hundreds of people			

**Table 31 Network Threat 004**

License Number	Threat#5-Potential Process Crash or Stop [DoS]	Threat Agent	Skill level	3 - Network and programming skills	6.125	HIGH	Technical Impact	Loss of confidentiality	4 - Minimal critical data disclosed, extensive non-sensitive data disclosed	4.75	MEDIUM	High	
			Motive	4 - Possible reward				Loss of integrity	3 - Minimal seriously corrupt data				
	License Number Module crashes, halts, stops or runs slowly; in all cases violating an availability metric.		Opportunity	4 - Special access or resources required				Loss of availability	7 - Extensive primary services interrupted				
			Group Size	9 - Anonymous				Loss of accountability	7 - Possibly traceable				
	Vulnerability	Ease of discovery	7 - Easy	Business Impact			Financial damage	7 - Significant effect on annual profit					
		Ease of exploit	5 - Easy				Reputation damage	4 - Loss of major accounts					
		Awareness	9 - Public knowledge				Non-compliance	5 - Clear violation					
		Intrusion detection	8 - Logged without review				Privacy violation	1 -					

**Table 32 Network Threat 005**

16. Login Information	Threat#6-Spoofing the 1.3 Control Interface Process [Spoofing]	Threat Agent	Skill level	4 - Advanced computer user	5.375	MEDIUM	Technical Impact	Loss of confidentiality	9 - All data disclosed	6.125	HIGH	High	
			Motive	4 - Possible reward				Loss of integrity	7 - Extensive seriously corrupt data				
	1.3 Control Interface may be spoofed by an attacker and this may lead to unauthorized access to 2.2 Authentication Module. Consider using a standard authentication mechanism to identify the source process.		Opportunity	5 -				Loss of availability	7 - Extensive primary services interrupted				
			Group Size	6 - Authenticated users				Financial damage	7 - Possibly traceable				
	Vulnerability	Ease of discovery	7 - Easy	Business Impact			Reputation damage	5 -					
		Ease of exploit	3 - Difficult				Non-compliance	4 - Loss of major accounts					
		Awareness	6 - Obvious				Privacy violation	5 - Clear violation					
		Intrusion detection	8 - Logged without review					1 -					

**Table 33 Network Threat 006**

16. Login Information	Threat#7-Potential Lack of Input Validation for 2.2 Authentication Modul [Tampering]	Threat Agent	Skill level	3 - Network and programming skills	4.125	MEDIUM	Technical Impact	Loss of confidentiality	5 - Extensive critical data disclosed	4.875	MEDIUM	Medium	
			Motive	4 - Possible reward				Loss of integrity	7 - Extensive seriously corrupt data				
	Data flowing across 16. Login Information may be tampered with by an attacker. This may lead to a denial of service attack against 2.2 Authentication Module or an elevation of privilege attack against 2.2 Authentication Module or an information disclosure by 2.2 Authentication Module. Failure to verify that input is as expected is a root cause of a very large number of exploitable issues. Consider all paths and the way they handle data. Verify that all input is verified for correctness using an approved list input validation approach.		Opportunity	7 - Some access or resources required				Loss of availability	7 - Extensive primary services interrupted				
			Group Size	6 - Authenticated users				Loss of accountability	7 - Possibly traceable				
	Vulnerability	Ease of discovery	3 - Difficult	Business Impact			Financial damage	3 - Minor effect on annual profit					
		Ease of exploit	3 - Difficult				Reputation damage	4 - Loss of major accounts					
		Awareness	4 - Hidden				Non-compliance	5 - Clear violation					
		Intrusion detection	3 - Logged and reviewed				Privacy violation	1 -					

**Table 34 Network Threat 007**

16. Login Information	Threat#8-Data Flow Sniffing[Information Disclosure]	Threat Agent	Skill level	9 - No technical skills	7.25	HIGH	Technical Impact	Loss of confidentiality	5 - Extensive critical data disclosed	4.875	MEDIUM	High	
			Motive	4 - Possible reward				Loss of integrity	7 - Extensive seriously corrupt data				
	Data flowing across 16. Login Information may be sniffed by an attacker. Depending on what type of data an attacker can read, it may be used to attack other parts of the system or simply be a disclosure of information leading to compliance violations. Consider encrypting the data flow..		Opportunity	7 - Some access or resources required				Loss of availability	7 - Extensive primary services interrupted				
			Group Size	9 - Anonymous Internet users				Loss of accountability	7 - Possibly traceable				
	Vulnerability	Ease of discovery	7 - Easy	Business Impact			Financial damage	3 - Minor effect on annual profit					
		Ease of exploit	5 - Easy				Reputation damage	4 - Loss of major accounts					
		Awareness	9 - Public knowledge				Non-compliance	5 - Clear violation					
		Intrusion detection	8 - Logged without review				Privacy violation	1 -					

**Table 35 Network Threat 008**

16. Login Information	Threat#9-Potential Process Crash or Stop for 2.2 Authentication Module[Denial Of Service]	Threat Agent	Skill level	3 - Network and programming skills	5.75	MEDIUM	Technical Impact	Loss of confidentiality	0 -	3.875	MEDIUM	Medium	
			Motive	1 - Low or no reward				Loss of integrity	1 - Minimal slightly corrupt data				
	2.2 Authentication Module crashes, halts, stops or runs slowly; in all cases violating an availability metric.		Opportunity	9 - No access or resources required				Loss of availability	9 - All services completely lost				
			Group Size	9 - Anonymous Internet users				Loss of accountability	9 - Completely anonymous				
	Vulnerability	Ease of discovery	7 - Easy	Business Impact			Financial damage	3 - Minor effect on annual profit					
		Ease of exploit	5 - Easy				Reputation damage	4 - Loss of major accounts					
		Awareness	9 - Public knowledge				Non-compliance	5 - Clear violation					
		Intrusion detection	3 - Logged and reviewed				Privacy violation	0 -					

**Table 36 Network Threat 009**

		Intrusion detection	6 - Logged without review				Privacy violation	1 -			

## 4.3 PnG Risk Assessment

### 4.3.1 Identify the PnG types, goals, motivations, skills

**Table 38 PnG 1**

PnG 1	Type	server developer
	Goal	Cause ALPR system malfunction, to ruin the Tartan's reputation
	Motivation	He is anger and want to revenge, because there are too much work, lower reward and he is finally fired
	Skill	Extensive knowledge of ALPR system, especially server side, computers, relevant programs, DB, PKI system and access to server system with administrator authority.
	Misuse case	1. Using a backdoor of server system, modify sensitive database file causing system malfunction 2. DDoS/DRDoS attack to known server's IP

Table 39 PnG 2

PnG 2	Type	License revoked driver
	<b>Goal</b>	Manipulating driver's license record
	<b>Motivation</b>	This person's license was revoked for multiple traffic violations. He wants to get his license back and drive normally.
	<b>Skill</b>	Trying to login with brute force
	<b>Misuse case</b>	1. Buying hackers or police officers with money to tamper with license records 2. Attempts to login with a brute force and succeeds in tampering with the license record

Table 40 PnG 3

PnG 3	Type	Police Officer
	<b>Goal</b>	Modify the plate information
	<b>Motivation</b>	Receive money and change plate information
	<b>Skill</b>	1. takeover a backdoor account accessing to Backend Server 2. repudiate that he has never accessed the backend server
	<b>Misuse case</b>	1.Using a second ID 2. remove audit

Table 41 PnG 4

PnG 4	Type	Hacker
	<b>Goal</b>	Show the anti-government slogans on the client screen.
	<b>Motivation</b>	He is an anarchist and hates the power of the nation.
	<b>Skill</b>	Code Injection, Buffer Overflow Attack, DDOS
	<b>Misuse case</b>	Hacker steals the system admin privilege and injects code to display slogans, then executes that code. He can also do DDOS attack.

Table 42 PnG 5

PnG 5	Type	Criminal
	<b>Goal</b>	Retrieve and tamper with traffic violation information. and it is used for crime.
	<b>Motivation</b>	to get financial gain
	<b>Skill</b>	subsumption ability and network of criminal engineers in various fields.
	<b>Misuse case</b>	He stole personal privacy information and used them for fraudulent crime.

Table 43 PnG 6

PnG 6	Type	System Manager
	<b>Goal</b>	Sneaking all information
	<b>Motivation</b>	Making a fortune
	<b>Skill</b>	Data replication using covert channel
	<b>Misuse case</b>	

#### 4.3.2 Comparison with STRIDE

Indicate whether they discovered threats that did not appear with STRIDE or whether it reinforced the STRIDE results

Table 44 Comparision With STRIDE

Threat		Comparison PnG
<b>Spoofing</b>	TID-S1, TID-S2	Similar with PnG case 4 & 5
<b>Tampering</b>	TID-N6 Login Information	Similar with PnG case 1 & 2 & 3 & 4
<b>Repudiation</b>	TID-N2, TID-N10, Repudiation User Authentication, License Number	Similar with PnG case 3
<b>Information disclosure</b>	TID-N3, TID-N7 User ID/PW, License Number	Similar with PnG case 4 & 5
<b>Denial of Service</b>	TID-S5, TID-N8, TID-N4 16. Login Information 21. Store Login Informaiton License Number	Similar with PnG case 1 & 4
<b>Elevation of Privilege</b>	TID-S3 TID-C8 TID-N9	Similar with PnG case 1 & 4

# 5 Architecture Design

## 5.1 System Architecture

### 5.1.1 System Context Diagram

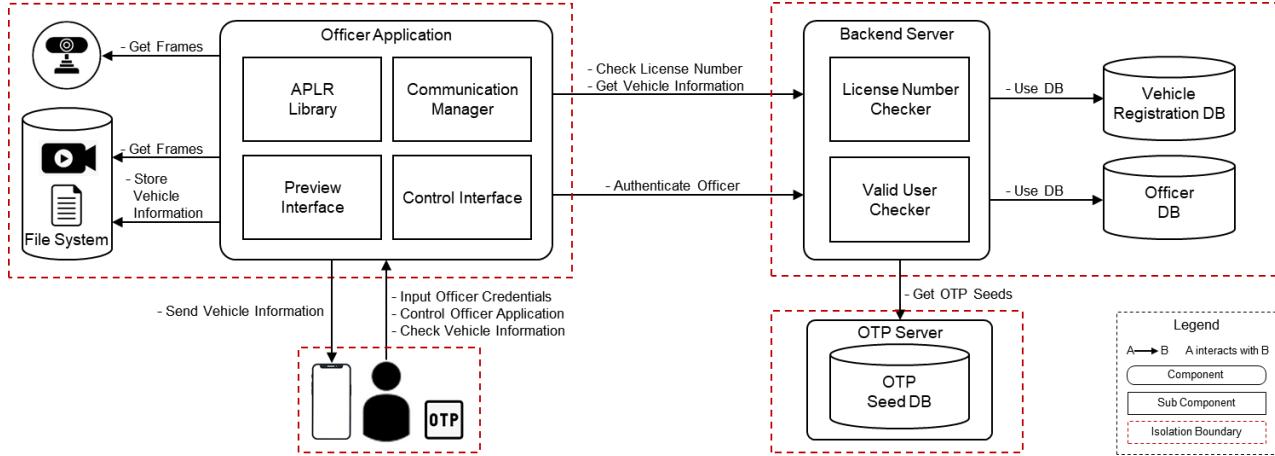

Figure 5 System Context Diagram

Table 45 Entity Description

1st Level	2nd Level	Description
Officer Application	APLR Library	Recognizes the license plate area from a specific frame image and extracts the license number
	Preview Interface	Outputs frame images and corresponding frame information
	Control Interface	Proceeds with officer's certification process for client application Sets operation mode of application(frame input selection) Outputs license information of cars
	Comm. Manager	Connect to backend server
User	Officer	Controls officer application
	OTP Device	Used for 2-factor authentication
	Mobile Phone	Officer checks vehicle information sent from officer app.
Backend Server	License Number Checker	Search and retrieve the vehicle information corresponding to license number delivered from client application from DB, and send those to client application again.
	Valid User Checker	Proceed with user authentication using the two factor authentication with the user ID/PW delivered from client application.
	Vehicle Registration DB	Stores various vehicle information for each vehicle license number.
	Officer DB	Stores officer's user credential, such as ID, PW, account recovery hint, etc
	OTP Seeds DB	Stores seed information of each physical OTP device.

### 5.1.2 State Transition

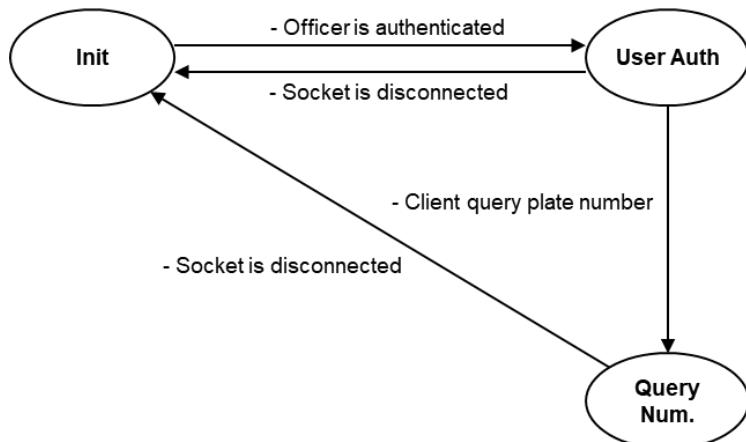

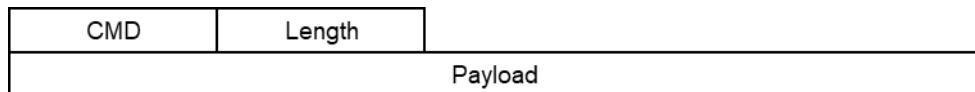

Figure 6 State Transition

Table 46 State Transition

State	Operation Description
Init	<ul style="list-style-type: none"> <li>- Server rejects all packets except for user authentication commands.</li> <li>- Once finishing the user authentication, state is switched to “User Auth” state.</li> <li>- If the number of currently connected client exceeds maximum number configured, server rejects all attempts to log in.</li> </ul>
User Authentication	<ul style="list-style-type: none"> <li>- Server accepts only plate number query command.</li> <li>- If user authentication commands arrives, server considers multiple log-in attempts with the same ID and closes the connection.</li> </ul>
Query Number	<ul style="list-style-type: none"> <li>- Server responds every query of client.</li> <li>- If connection is closed, state is switched to “Init” state</li> </ul>

### 5.1.3 Communication Packet

- Two packets are delivered sequentially : Header + Payload

- CMD is used to check whether client packet corresponds with server state
- Payload consists of contents corresponding to CMD.

## 5.1.4 System Service Sequence

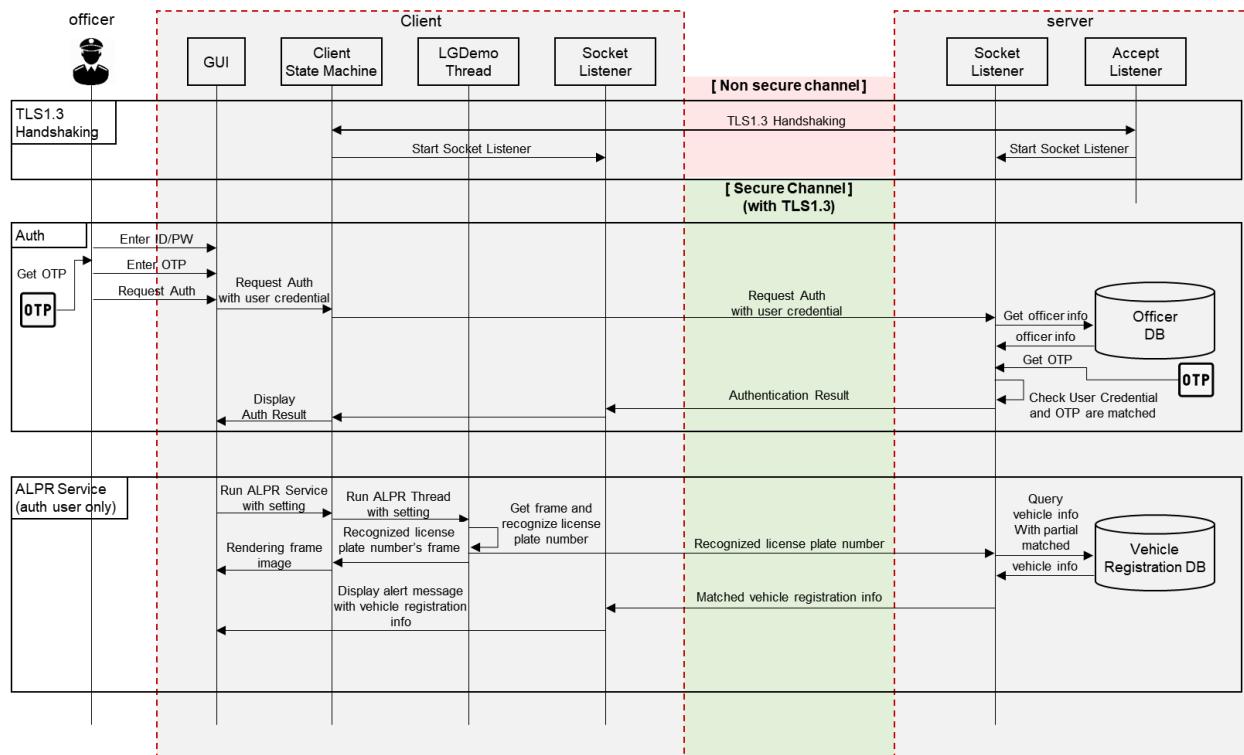

Figure 7 System Service Sequence

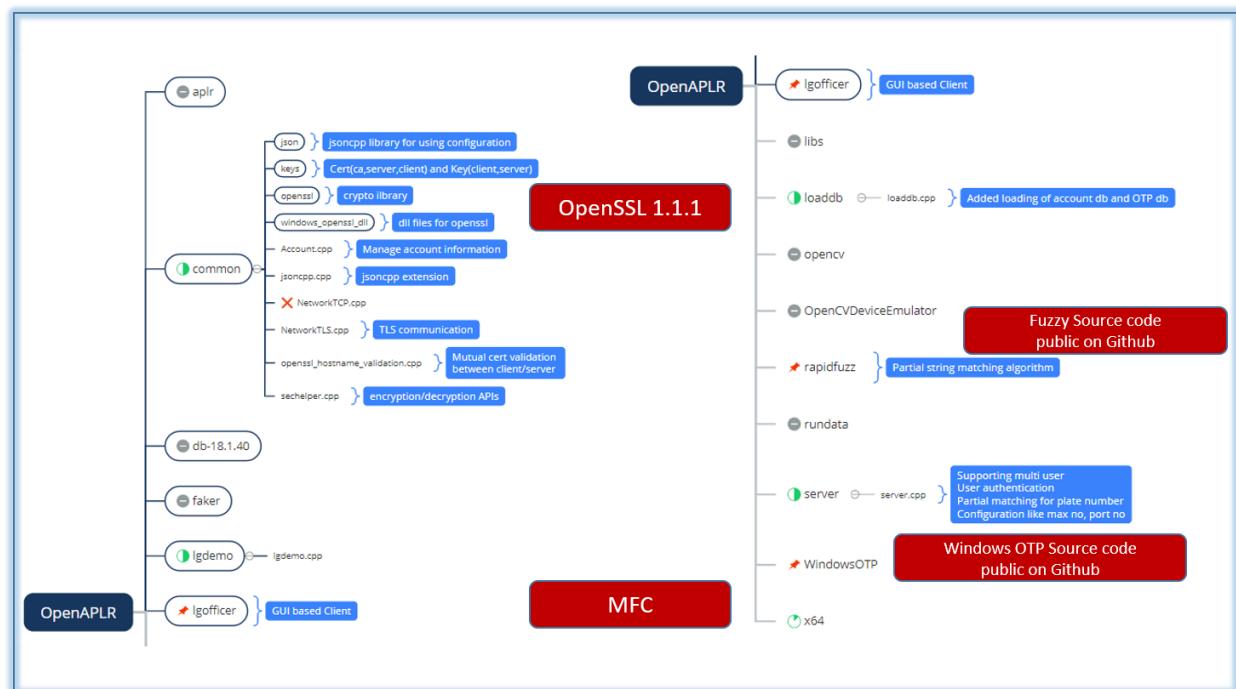

Figure 8 Source Tree

## 5.2 Client Architecture

### 5.2.1 Client State Diagram

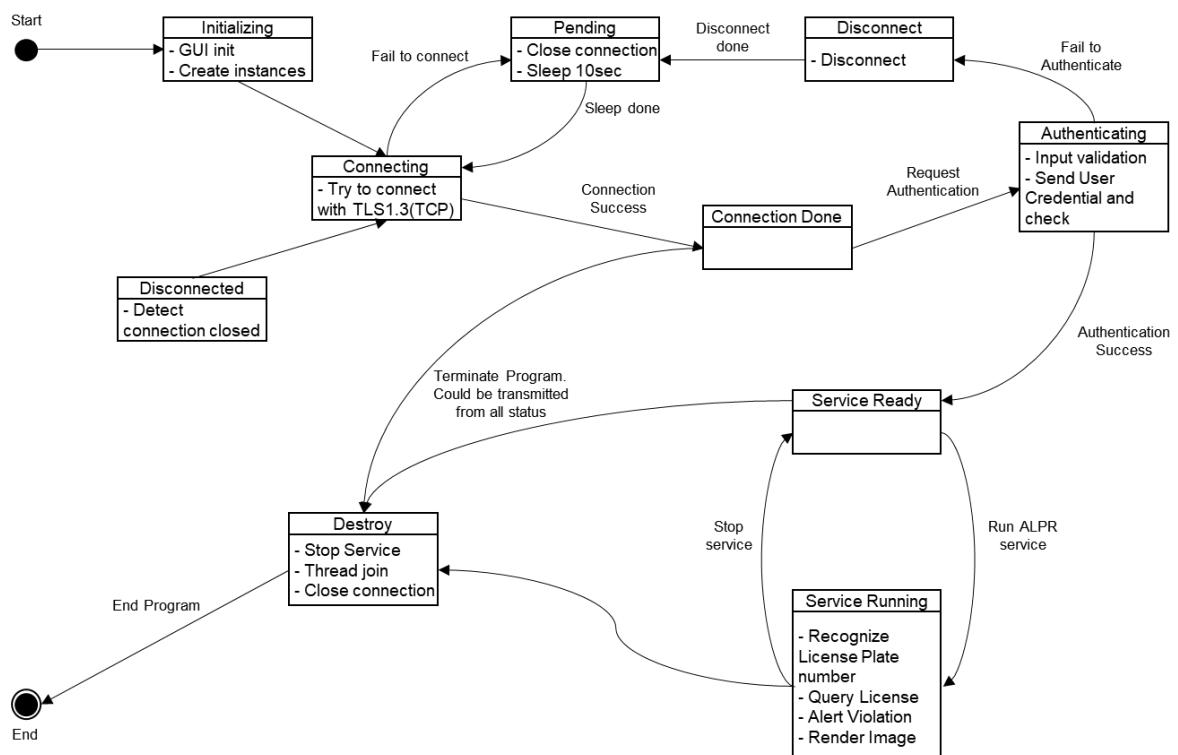

Figure 9 Client State Diagram

## 6 Mitigation

### 6.1 2 Factor Authentication.

#### 6.1.1 Basic Concept

Figure 10 2FA Basic Concept

#### 6.1.2 Cross-verifies users with two different forms of identification

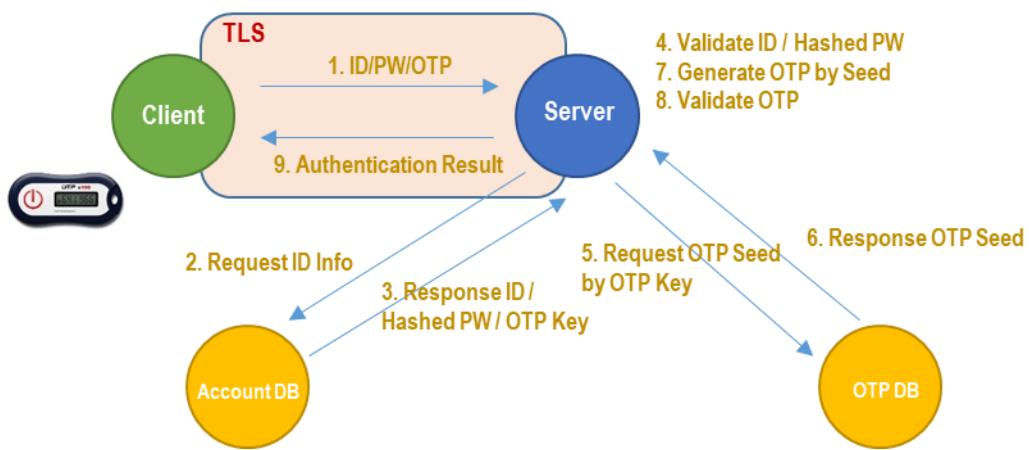

Figure 11 Cross-verifies users

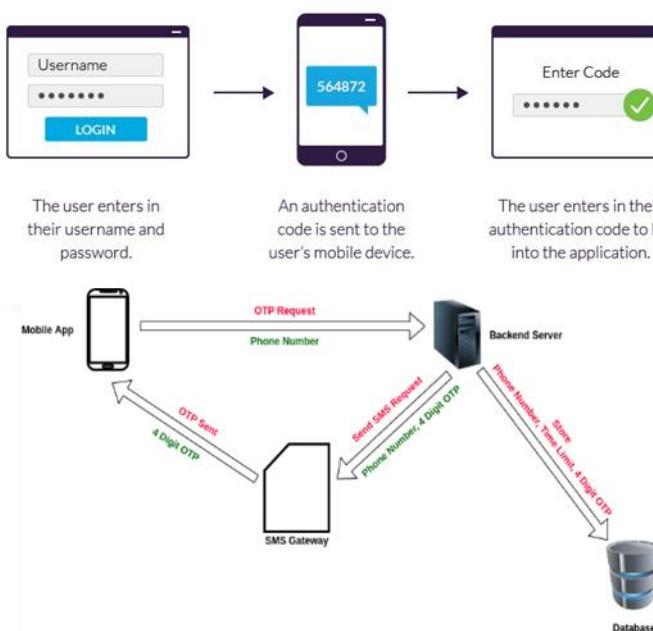

Figure 12 OTP identification

### 6.1.3 2FA Basic Scenario

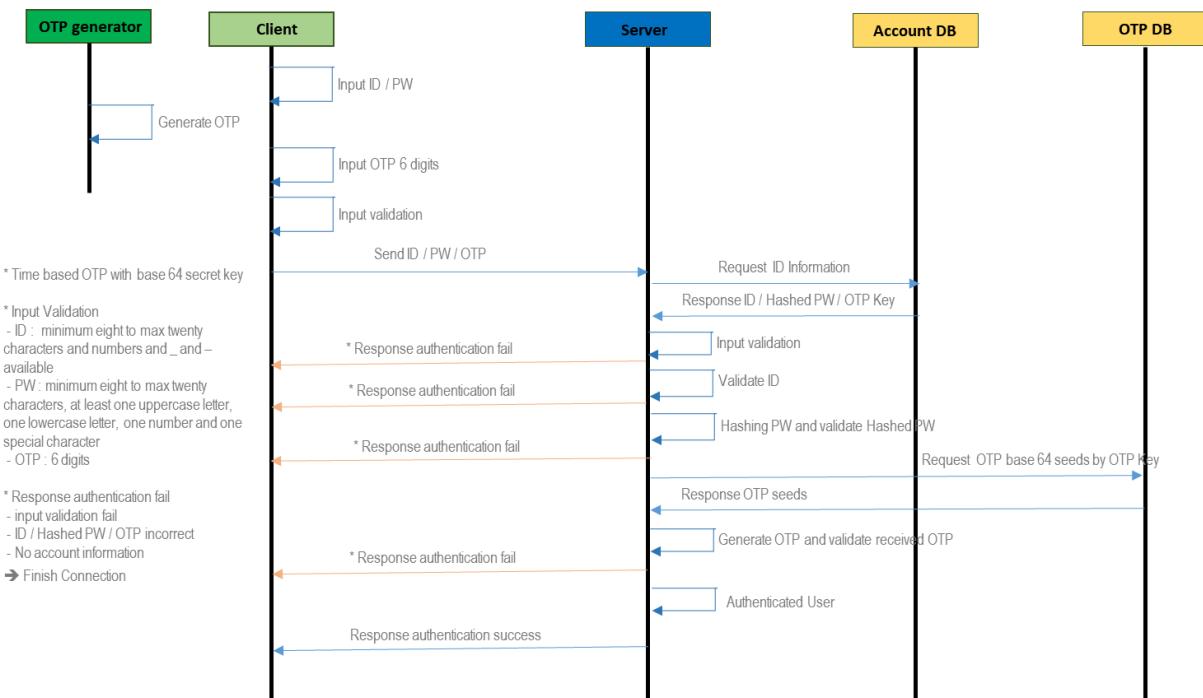

Figure 13 2FA Basic Scenario

### 6.2 TLS/SSL

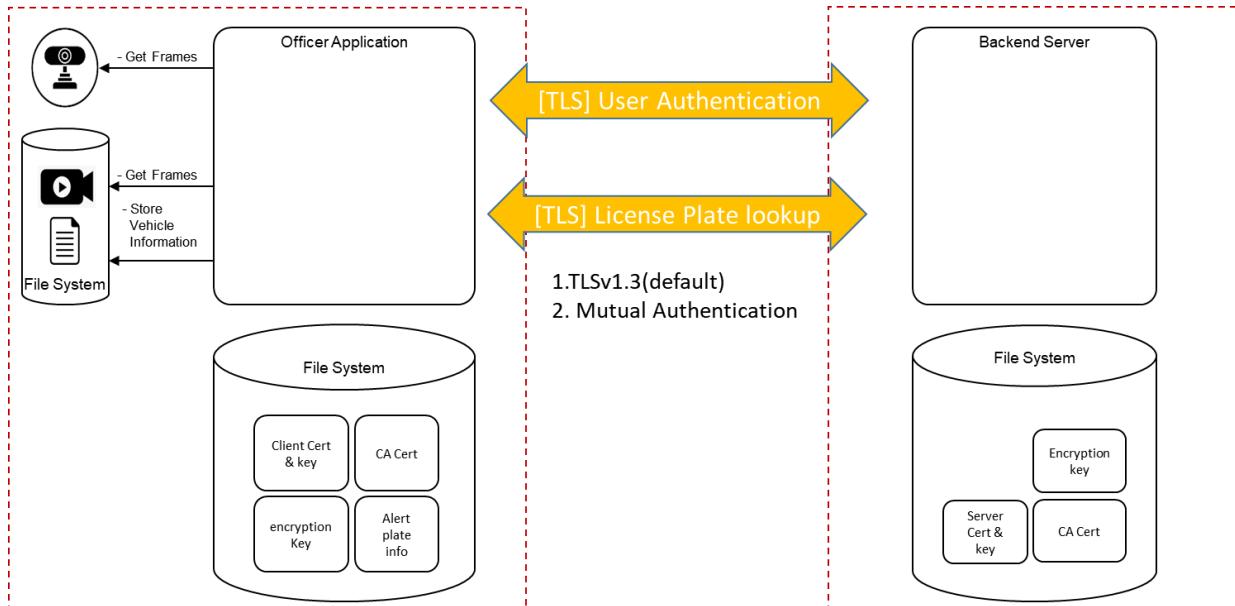

Figure 14 TLS/SSL

## 6.3 Input Validation

### 6.3.1 Possible Attack Cases

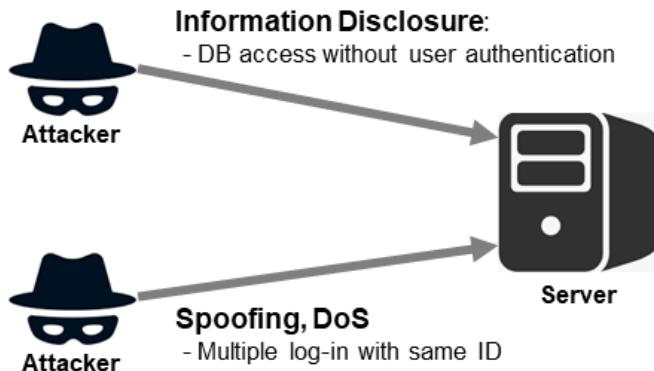

Figure 15 Possible Attack Cases

### 6.3.2 Mitigation

- Keep state consistency between server and client
- Prevent multiple log-in with same ID
- Limit the number of concurrent connected client

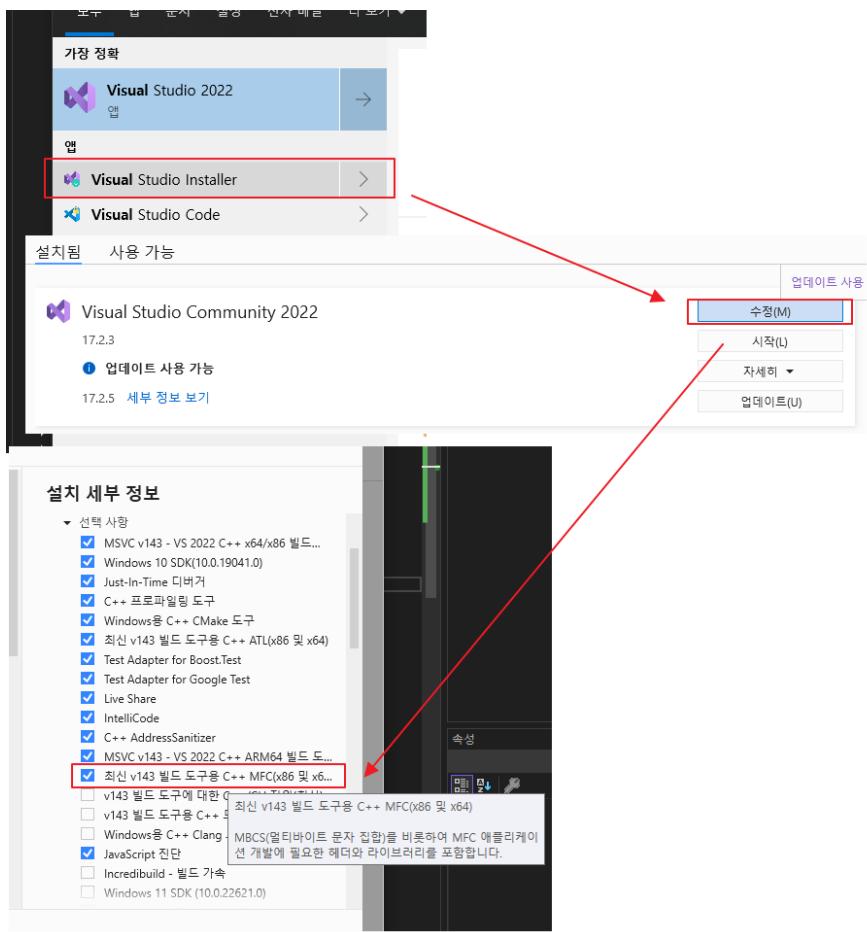

# 7 Implementation

---

## 7.1 Build Project

### 7.1.1 Pre-Condition

- 1) Copy "opencv" directory and all files in it to the root directory of "OpenAPLR\_Team4" project.  
(You can find it from the original source codes (OpenAPLR-3.1.1\_Vs2022/opencv))
- 2) Install MFC to visual studio as below picture.

**Figure 16 Pre-Condition for build**

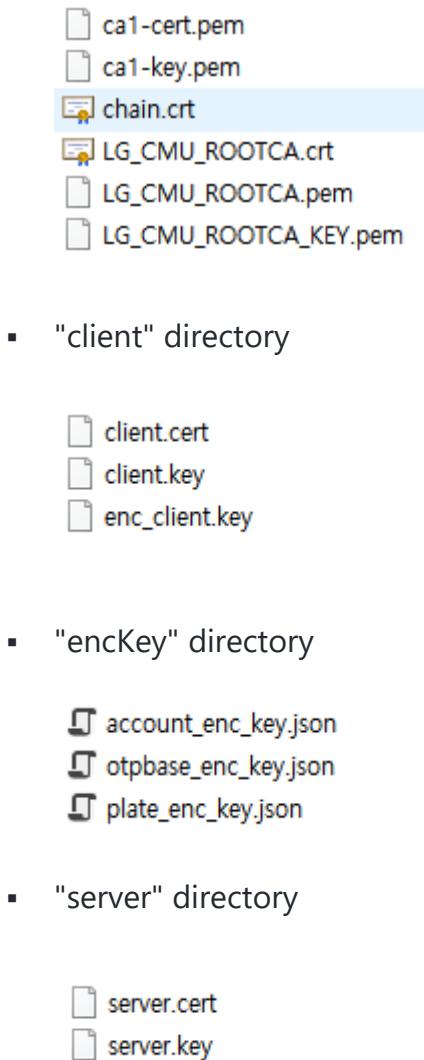

### 7.1.2 Build

- 1) Open "OpenALPR.sln" solution file with visual studio
- 2) Make sure "Release/x64" is selected as a build configuration.
- 3) Execute "solution build"

## 7.2 Execute Program

### 7.2.1 Pre-Condition

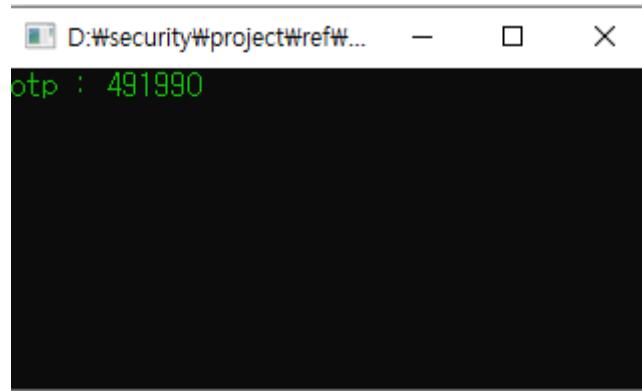

- 1) Execute "setup.bat"
  - "setup.bat" will move all files required to run, including key and cert to "x86/release".
- 2) Check if all files described below exist normally.
  - "x64/release" directory
    - configuration files : server-conf.json, client-conf.json
    - db data files : db/account.db, licenseplate.db, otpbase.db
    - "keys" directory
      - "ca" directory

### 7.2.2 Run

If you want to run server or client on other windows computer, Copy "Release" in x64 directory directory to the target device.

- 1) Run Server
  - Execute "server.exe"(located in x64/Release) before running "Igofficer" as a client.
- 2) Run Client
  - Execute Igofficer
    - If the client and server are running on different devices,
      - ① check ip address of server.
      - ② open x64/Release/client-conf.json then modify server\_ip.
    - Execute OTPGen Application (See the "OTPGen" directory)
      - Let's try User #6 (one of several users in the account database) in this guide.
      - Run "OTPGen\_SecurityPolice\_006.exe" and you can see the otp number and it ill be changed periodically.

**Figure 17 OTP Generator**

- Pass Log-in information on the "lgofficer" application.
  - For blank text box, fill in like below.
  - ID : SecurityPolice\_006
  - PW : !dlwormsS4Best
  - OTP : Check the number in the OTP program that has already been run.
  
- Start process
  - If user authentication is succeeded, Start button will be enabled like below.
  - Push the "Start" button.

### 7.3 Test

**Table 47 Test Cases**

SRS ID	TC ID	TC Name	Procedure	Expected	Result	Note
REQ_CLI_01	TC-01	User login with two factor authentication	1. run lgofficer.exe 2. Check status in lgofficer diaglog 3. Insert ID/PW and OTP number from OTP generator which is dedicated to each user 4. Click Login Button 5. Check login success message in message box	2. Need to Auth 5. login - success	Pass	
REQ_CLI_02	TC-02	Handle lost or compromised credentials	1. run lgofficer.exe 2. Click Find PW below OTP edit control 3. Call to IT service	2. Popup message is displayed	Pass	IT service's number is virtual number, do not call

REQ_CLI_03	TC-03	select and save retrieved information locally.	<p>1. Select radio buttons for media, save policy and resolution for ALPR service</p> <p>2. Click Start Button</p> <p>3. Check below combination</p> <p>3-1-1) Playback/NoSave/640x480</p> <p>3-1-2) Playback/Save/1280x720</p> <p>3-1-3) Playback/Save No ALPR/640x480</p>	<p>3-1-1) Run Playback. and recognize certain license plate number and there is no output.avi</p> <p>3-1-2) Run Playback. and recognize certain license plate number and check output.avi which is saved</p> <p>3-1-3) Run Playback. and do not recognize certain license plate and check output.avi which is saved and recognized information is not displayed in video</p>	Pass	
REQ_CLI_04	TC-04	secure communication(TLS1.3)	<p>1. Run lgofficer.exe</p> <p>2. Check status in lgofficer diaglog</p> <p>3. Check Wireshark packet to verify TLS1.3 establishment</p> <p>4. Input user id/pw/OTP(refer to TC-10) and click login button to check user credential is encrypted or not</p>	<p>2. Need to Auth</p> <p>3. Check TLS1.3 handshaking Client Hello</p> <p>Server Hello, Change Cipher Spec, Change Cipher Spec,</p> <p>4. User Credential is not exposed. we can only see Application Data Packet</p>	Pass	
REQ_CLI_05	TC-05	Recognize license plate number	1. Start ALPR service with Live/Playback/Image	1. Check recognized number in "Recognized Image" section's image	Pass	
REQ_CLI_06	TC-06	ALPR function maintaining a frame rate of at least 25fps.	1. Start ALPR service with playback and check displayed fps text	1. Check fps	Pass	1. If PC's has poor CPU performance, fps could be lower.
REQ_CLI_07	TC-07	query the backend license plate through server's db	<p>1. Start ALPR service with playback</p> <p>2. If when detecting license number which registered in server plate DB, wait for alert message is displayed</p>	2. Alert Message with vehicle registration information is displayed	Pass	
REQ_CLI_08	TC-08	If a license plate does not generate an alert, then the user interface must display the	<p>1. Start ALPR service with playback</p> <p>2. If when detecting license number which registered in server plate DB, display recognized frame image</p> <p>3. if next recognized license is not registered in DB, keep previous recognized image in UI</p>	<p>2. Recognized Image</p> <p>3. Previous recognized image</p>	Pass	

		last recognized plate image			
REQ_CLI_09	TC-09	provide the current camera /playback view.	1. Start ALPR service with camera/playback 2. Check new window for current carmera/playback view	2. new window for current carmera/playback view is displayed	Pass
REQ_CLI_10	TC-10	display computed camera / playback frames per second, average time per frame, jitter and frame number	1. Start ALPR service with camera/playback 2. Check fps, average time per frame, jitter, frame number	2. Check fps, average time per frame, jitter, frame number on bottom of recognized image	Pass
REQ_CLI_11	TC-11	The system should allow the officer to choose between using a live camera and playback file in the UI.	1. Select radio buttons for media, save policy and resoultion for ALPR service 2. Click Start Button 3. Check below combination 3-1-1) Live/Save/1280x720 3-1-2) Playback/Save (Need to select video file)	3-1-1) Run Live Camera with 1280x720 resolution. and recognize certain license plate number and check output.avi which is saved 3-1-2) Run playback video and recognize licence plate in video and check output.avi which is saved	Pass
REQ_CLI_12	TC-12	detect network connectivity issues with the backend server within 5 seconds and automatically resolve the communicatio n	1. Terminate server.exe and check status in UI 2. Restart server.exe as soon as possible within 5sec 3. Check status	1. Disconnected 3. Need to Auth (it means retry connection is succeed)	Pass

REQ_CLI_13	TC-13	alert communication errors or failures.	1. Terminate server.exe and check message box	1. disconnect! message is printed	Pass	
REQ_CLI_14	TC-14	The system must fetch vehicle information in no more than 10 seconds as officers are often making queries in real time.	1. Start ALPR service with camera/playback 2. Check time duration by wireshark pakcet time diff = recevie time - send time	2. check do not exceed 10sec	Pass	vehicle information is recievied only if there is (partial)matched license number
REQ_SVR_0 1	-	Support license plate queries.				Ref to TC-08
REQ_SVR_0 2	-	secure communication(TLS1.3)				Ref to TC-05
REQ_SVR_0 3	-	Authenticate remote laptop users.				Ref to TC-01/TC-05
REQ_SVR_0 4	TC-16	Support multiple users.	1. run logofficer.exe and login with user1 2. run logofficer.exe and login with user2	1./2. user1,2 are authenticated	Pass	Server supports max 10 users
REQ_SVR_0 5	TC-17	the best match license plate if there is not an exact match that includes a configurable minimum confidence threshold to support a partial match.	1. Start ALPR service with camera/playback	1. If when recieve license query from client and there is no exact match Displayed like below in server's console log Payload=LKY136D, Plate Number=LKY1360, Matching Rate=85.71%	Pass	threshold is 70%

REQ_SVR_0 6	TC-18	query statistics	1. Start ALPR service with camera/playback	1. query statistics is displayed every 5sec User[SecurityPolice_006] average queies per sec : 0.2000	Pass	
REQ_SVR_0 7	TC-19	partial match statistics	1. Start ALPR service with camera/playback	1. If when receive license query from client and there is no exact match  Displayed like below in server's console log  Payload=LKY136D, Plate Number=LKY1360, Matching Rate=85.71%	Pass	
REQ_SVR_0 8	TC-20	Configurable values for server setting	1. open server-conf.json 2. change port to 2223 3. run server.exe 4. run lgofficer.exe 5. check status	5. loop below status  Connecting  Wait...(10sec)	Pass	

## 8 Seeded Vulnerabilities

---

### 8.1 VU01 - Null pointer dereference could have occurred when an alert message is written in a log file after service is stopped

Table 48 Seeded Vulnerability 01

Description	[VU01] Null pointer dereference could have occurred when an alert message is written in a log file after service is stopped.
STRIDE	Denial of Service
Detail	socket listener is always on and displaying and writing an alert message is could be done regardless of it state  "file pointer of the alert message file is opened when running the service and closed when stopping the service  "  it is a synchronization issue. stop first, the file pointer is closed then an alert message is came  in this case, null pointer dereferencing could have occurred
PoC	
	1. load network traffic on server to increase packet latency(ping, iperf, etc)

<p>2. login and start ALPR service with playback video(beaver1.avi)</p> <p>3. try to stop as soon as license recognition packet query is sended</p> <p>4. iterate until application is crashed. The frequency of occurrence is about once among 20 attempts (5%)</p> <p>5. application crash is occurred due to absent of null pointer check</p> <pre> do {     written += fwrite(payload, 1, remain, fp);     remain -= written; } while (written &lt; sizeof(payload)); </pre>			
CVSS Score	<i>CVSS Base Score: 3.3</i> <i>Impact Subscore: 1.4</i> <i>Exploitability Subscore: 1.8</i> <i>CVSS Temporal Score: 3.3</i> <i>CVSS Environmental Score: 3.3</i> <i>Modified Impact Subscore: 1.4</i> <i>Overall CVSS Score: 3.3</i>  <i>Severity : Low</i>	Source Code	ClientMachine.cpp line : 757~761 line : 1064~1070
Consequence / Impact			
It cause denial of service in client application due to system crash			

## 8.2 VU02 - Backdoor - ID/PW based on factorization of big number

Table 49 Seeded Vulnerability 02

Description	[VU02] Backdoor - ID/PW based on factorization of big number
STRIDE	Elevation of Privilege
Detail	<ul style="list-style-type: none"> <li>- Backdoor for Developer</li> <li>ID = (Prime A) * (Prime B)</li> <li>PW = Prime A or Prime B</li> <li>ID/PW Authentication : if (ID / PW) == (Integer), then Authenticate</li> <li>For the number to be used as the ID, choose a number large enough to take a week or two with the current NotePC computing power.</li> </ul>
PoC	<ol style="list-style-type: none"> <li>1. Attacker can check the ID for backdoor by analyzing shared codes.</li> <li>2. Attacker can check the procedure of backdoor authentication by using shared codes.</li> <li>3. Attacker gets the password by factorization of ID number</li> <li>4. Attacker can infer the order of two prime numbers by considering the order of the ID number, and</li> </ol>

<p>proper prime numbers can be selected sequentially by using</p> <ul style="list-style-type: none"> <li>- Brute-Force</li> <li>- A list of known prime numbers</li> </ul> <p>(<a href="http://compoasso.free.fr/primelistweb/page/prime/liste_online_en.php">http://compoasso.free.fr/primelistweb/page/prime/liste_online_en.php</a>)</p>			
CVSS Score	<i>CVSS Base Score: 5.9</i> <i>Impact Subscore: 3.6</i> <i>Exploitability Subscore: 2.2</i> <i>CVSS Temporal Score: 5.6</i> <i>CVSS Environmental Score: 7.3</i> <i>Modified Impact Subscore: 5.4</i> <i>Overall CVSS Score: 7.3</i>  <i>Severity : High</i>	Source Code	server.cpp line : 411~440
Consequence / Impact			
An attacker without access rights can gain access to the system			

### 8.3 VU03 - Tampering configuration file results in TCP connection (not TLS)

Table 50 Seeded Vulnerability 03

Description	[VU03] Tampering configuration file results in TCP connection (not TLS)					
STRIDE	Tampering					
Detail	<ul style="list-style-type: none"> <li>- tcp connection is conducted through OpenTcpConnection function which we implemented</li> <li>- this function has argument const char* ca_pem, const char* cert_pem, const char* key_pem from configure file but when fail to read CA path from configure file, it returns NULL</li> <li>- when NULL is passed, it tries to TCP connection rather than TLS</li> <li>- it results in non-secure channel establishment</li> </ul>					
PoC						
<ol style="list-style-type: none"> <li>1. restart the server by deleting the ""server_cert_path"", ""server_key_path"", ""ca_cert_path"" value to the server's config file</li> <li>2. On the server side, it changes from tls socket communication to unprotected socket communication.</li> </ol>						
CVSS Score	<i>CVSS Base Score: 5.7</i> <i>Impact Subscore: 5.2</i> <i>Exploitability Subscore: 0.5</i> <i>CVSS Temporal Score: 5.4</i>	Source Code	NetworkTLS.cpp line :261~263 line : 542~708 line : 745~758			

	<i>CVSS Environmental Score: 6.1</i> <i>Modified Impact Subscore: 5.9</i> <i>Overall CVSS Score: 6.1</i>  <i>Severity : Medium</i>		line : 780~828 line : 851~860  server.cpp 729~740
<b>Consequence / Impact</b>			
Mutual authentication based on PKI certificates is not supported.			

## 8.4 VU04 - Sniffing ID/Password/OTP/Plate Information

**Table 51 Seeded Vulnerability 04**

Description	[VU04] Sniffing ID/Password/OTP/Plate Information		
STRIDE	Information Disclosure		
Detail	- The communication channel for the user credentials is not secure by changing server and client configuration settings		
PoC	<ol style="list-style-type: none"> <li>1. restart the server by deleting the ""server_cert_path"", ""server_key_path"", ""ca_cert_path"" value to the server's config file</li> <li>2. On the server side, it changes from tls socket communication to unprotected socket communication.</li> </ol>		
CVSS Score	<i>CVSS Base Score: 5.7</i> <i>Impact Subscore: 5.2</i> <i>Exploitability Subscore: 0.5</i> <i>CVSS Temporal Score: 5.4</i> <i>CVSS Environmental Score: 6.1</i> <i>Modified Impact Subscore: 5.9</i> <i>Overall CVSS Score: 6.1</i>  <i>Severity : Medium</i>	Source Code	NetworkTLS.cpp line :261~263 line : 542~708 line : 745~758 line : 780~828 line : 851~860  server.cpp 729~740
<b>Consequence / Impact</b>			
The socket communication data is not protected and it becomes possible to sniff for plate number and driver's license information.			

## 8.5 VU05 - Problem of certificate validation

**Table 52 Seeded Vulnerability 05**

Description	[VU05] Problem of certificate validation		
STRIDE	Spoofing		
Detail	-RootCA doesn't be used for CA certificate validation. So, if server key, cert and CA cert are changed, a spoof attack is possible		
PoC			
1. generate server key, certificate and self-signed CA certificate for attack 2. replace the new generated server private key, certificate and ca certificate 3. try to connect TLS with the new forged certificate. 4. TLS channel is successfully established			
CVSS Score	<i>CVSS Base Score: 8.1</i> <i>Impact Subscore: 5.2</i> <i>Exploitability Subscore: 2.8</i> <i>CVSS Temporal Score: 7.7</i> <i>CVSS Environmental Score: 7.1</i> <i>Modified Impact Subscore: 5.9</i> <i>Overall CVSS Score: 7.1</i>  <i>Severity : High</i>	Source Code	NetworkTLS.cpp 206 line
Consequence / Impact			
the certificate chain must be validated by rootca			

## 8.6 VU06 - Buffer overflow of Alert.log data

**Table 53 Seeded Vulnerability 06**

Description	[VU06] Buffer overflow of Alert.log data		
STRIDE	Spoofing		
Detail	- the maximum buffer size is 32768 - if the alert.log size over the maximum, the client is abnormally terminated.		
PoC			
1. make a big size(over 33kb) alert.log() file on the Release folder. 2. push the button ""Encrypt"" 3. Igofficer will be died and restarted.			
CVSS Score	<i>CVSS Base Score: 3.3</i> <i>Impact Subscore: 1.4</i> <i>Exploitability Subscore: 1.8</i> <i>CVSS Temporal Score: 3.2</i>	Source Code	IgofficerDig.cpp 435~460line sechelper.cpp 342~349 line

	<p><i>CVSS Environmental Score: 3.2</i></p> <p><i>Modified Impact Subscore: 1.4</i></p> <p><i>Overall CVSS Score: 3.2</i></p> <p><i>Severity : Low</i></p>		sechelper.h 25,50 line
<b>Consequence / Impact</b>			
attacker can use this vulnerability for DoS attack			

## 8.7 VU07 - Display id and password in the log of server-side

**Table 54 Seeded Vulnerability 07**

Description	[VU07] Display id and password in the log of server-side		
STRIDE	Information Disclosure		
Detail	<ul style="list-style-type: none"> <li>- Admin account which skips 2FA can be used to neutralize 2FA.</li> <li>- ID and password of admin account cab be checked via over-the-shoulder sniffing.</li> <li>- Attacker can use dictionary attack as well.</li> </ul>		
PoC	<ol style="list-style-type: none"> <li>1. Obtain administrator account information(ID/Password) via over-the-shoulder or dictionary attck or restart the server by adding the { ""debug"" : ""true""} value to the server's config file</li> <li>2. Login through the administrator's id/password in the client side</li> <li>3. Login succeeds without 2 authentication factor by OTP.</li> </ol>		
CVSS Score	<p><i>CVSS Base Score: 4.9</i></p> <p><i>Impact Subscore: 3.6</i></p> <p><i>Exploitability Subscore: 1.2</i></p> <p><i>CVSS Temporal Score: 4.7</i></p> <p><i>CVSS Environmental Score: 6.3</i></p> <p><i>Modified Impact Subscore: 5.4</i></p> <p><i>Overall CVSS Score: 6.3</i></p> <p><i>Severity : Medium</i></p>	Source Code	server.cpp line : 230~232 line : 352~356
<b>Consequence / Impact</b>			
Two authentication factor using OTP is disabled in the user authentication process. so attacker is possible to get plate number and driver's license information.			

## 8.8 VU08 - No input validation method for partial matching threshold in the configuration file

Table 55 Seeded Vulnerability 08

Description	[VU08] No input validation method for partial matching threshold in the configuration file		
STRIDE	Tampering, Denial of Service		
Detail	<ul style="list-style-type: none"> <li>- Attacker can manipulate the partial matching value in the config file to not be detected illegal vehicles.</li> <li>- If the partial matching threshold is very high then every vehicle wouldn't be detected even if it is the illegal vehicle</li> </ul>		
PoC	<ol style="list-style-type: none"> <li>1. Access the config file that manages server settings</li> <li>2. Modify the ""num_thr_partial"" value to 100 or more to set the part recognition criteria of the license plate</li> <li>3. Restart the server to apply the config.</li> <li>4. Even if it is a vehicle that violates the license plate, the license plate cannot be matched any more.</li> </ol>		
CVSS Score	<i>CVSS Base Score: 4.4</i> <i>Impact Subscore: 3.6</i> <i>Exploitability Subscore: 0.8</i> <i>CVSS Temporal Score: 4.3</i> <i>CVSS Environmental Score: 6.1</i> <i>Modified Impact Subscore: 5.4</i> <i>Overall CVSS Score: 6.1</i>  <i>Severity : Medium</i>	Source Code	server.cpp line : 721~724
Consequence / Impact	It is possible to avoid enforcement by interfering with illegal vehicle detection in the server for the license plate recognized by the client.		

## 8.9 VU09 - Weak point of protocol about packet command processing

Table 56 Seeded Vulnerability 09

Description	[VU09] Weak point of protocol about packet command processing
STRIDE	Elevation of Privilege
Detail	<ul style="list-style-type: none"> <li>- Attacker can make and send the pseudo packet pretending the normal communication.</li> </ul>

	<p>- Currently, '3' cmd is not used for any purpose, but can be used to neutralize the user authentication procedure.</p>		
PoC	make and send the pseudo packet pretending the normal communication.		
CVSS Score	<i>CVSS Base Score: 5.9</i> <i>Impact Subscore: 3.6</i> <i>Exploitability Subscore: 2.2</i> <i>CVSS Temporal Score: 5.8</i> <i>CVSS Environmental Score: 7.5</i> <i>Modified Impact Subscore: 5.4</i> <i>Overall CVSS Score: 7.5</i>  <i>Severity : High</i>	Source Code	server.cpp Should have put ""break"" in next line of 313  Should have put like below in next line of 314 if ((PacketCmd == 2    PacketCmd == 3)) { printf("""Rx      invalid cmd  :  cur  stat(%d) cmd(%d)\n""", PerUserData->state, PacketCmd); goto free_resource; }
Consequence / Impact	After making communication session, if attacker sends '3' cmd pretending normal packet, server can receive '2' cmd for getting plate number information.		

## 8.10 VU10 - Tampering with the file that is used for storing alert information (TOCTOU )

Table 57 Seeded Vulnerability 10

Description	[VU10] Tampering with the file that is used for storing alert information (TOCTOU )		
STRIDE	Tampering		
Detail	<ul style="list-style-type: none"> <li>- Client application saves vehicle information to a text file for illegal vehicles</li> <li>- Attacker can modify or delete text file by TOCTOU attack.</li> </ul>		
PoC	<ol style="list-style-type: none"> <li>1. Access the file path that stores the illegal vehicle detection history in the client</li> <li>2. Open the file and modify or delete the detected list.</li> </ol>		
CVSS Score	<i>CVSS Base Score: 7.1</i> <i>Impact Subscore: 5.2</i>	Source Code	ClientMachine.cpp line : 1064~1070

	<p><i>Exploitability Subscore: 1.8</i></p> <p><i>CVSS Temporal Score: 6.9</i></p> <p><i>CVSS Environmental Score: 7.6</i></p> <p><i>Modified Impact Subscore: 5.9</i></p> <p><i>Overall CVSS Score: 7.6</i></p> <p><i>Severity : High</i></p>		
<b>Consequence / Impact</b>			
Recognized contents are altered by deleting or manipulating files that store illegal vehicles information			

## 9 Phase-1 Lessons Learned

---

### 9.1 Lesson #1 - *Consider it in the early phases*

- ✓ Importance of abstracting security requirement from initial phase.
- ✓ In the process of converting a program based on traditional TCP communication to TLS-based communication, many difficulties were encountered.
- ✓ This is an obvious technical debt, and it is a cost that would not have been incurred if TLS was considered from the initial requirements analysis stage.

### 9.2 Lesson #2 - *Opportunity to learn and experience the secure development methodology*

- ✓ Opportunity to learn the secure development methodology, such as extracting requirements from asset, threat, risk analysis and applying secure coding.

### 9.3 Lesson #3 - *Having secondary security measures*

- ✓ 2FA offer better protection than passwords alone.

### 9.4 Lesson #4 - *Consider security development process*

- ✓ Organizations that do not implement a vulnerability management process are at significantly increased risk of experiencing a security incident.

## **Phase 2 : Security Analysis of Classmate System**

# 1 Phase 2 Introduction

---

We reviewed and analyzed Team 3's artifacts to identify assets and security goals, identified attack surfaces, and discovered vulnerabilities through design and code reviews. The vulnerabilities were then assessed and classified. In addition, methods for attacking each vulnerability were derived and verified.

**Artifacts of Team 3 :** [https://github.com/kibongs/3team\\_studio\\_project](https://github.com/kibongs/3team_studio_project)

## 1.1 Phase 2 Goals

- Breaking Confidentiality
  - Steal the Credentials and Plate information
- Breaking Integrity
  - Pollute user DB
- Breaking Availability
  - Make the system unavailable

# 2 Design Review

---

This section describes a review of Team Purple's design documentation.

## 2.1 Security Goals

Table 58 Security Goals

ID	Statement
G-01	System should maintain confidentiality and integrity of databases when a system admin or an officer reads and writes databases.
G-02	The confidentiality of the network communication should be maintained when the server and a client communicate.
G-03	System needs to detect a breach of personal identifiable information of databases when an admin or an officer read and write databases.

## 2.2 Security Requirements

Table 59 Security Requirements

No	Preliminary Requirement	Component	Requirement Specification
SR1	All users accessing the DB of the system must be authenticated.	server	server authentication is commonly performed by submitting a username or ID and OTP of private information that only a given user should know.
SR2	The DB of the system must be encrypted	server	Use 128-bit AES to encrypt data in the user DB and the driver/car Information DB.
SR3	User permissions to access DB should be classified and managed.	server	only allow Read permission - Ensure that least-privileged accounts are used to connect to Database server - Sysadmin role should only have valid necessary users
SR4	The server must be capable of responding to a large number of queries.	server	Immediate recovery Deploy server as a container (fault tolerance)
SR5	Communication history management using communication channel between client and server should be performed.	server & client	Ensure that auditing and logging is enforced on the application The client application records and saves requests sent to the server in a file.
SR6	The query statement through the communication channel between the client and the server must be verified.	server & client	Perform input validation and filtering on all string type Model properties All the input parameters must be validated before they are used in the application to ensure that the application is safeguarded against malicious user inputs. Validate the input values using regular expression validations on server side with a allowed list validation strategy. Unsanitized user inputs / parameters passed to the methods can cause code injection vulnerabilities.
SR7	The communication channel between the client and the server must be encrypted.	server & client	Enable HTTPS - Secure Transport channel The application configuration should ensure that HTTPS is used for all access to sensitive information.
SR8	The client system can only use digitally signed queries.	server & client	Apply authentication token

SR9	The client user should use a strong password.	client	client application support Proper Password Strength Controls. - Password limit: 8 to 20 characters - Password string limit: Must contain at least one lowercase letter, uppercase letter, and number - Password special characters: ~!@#\$%^&*(),<.>/?]+
SR10	The server must manage the digital signature.	server	Change the token generation key periodically.

## 2.3 System Architecture Design

# 3 Analysis

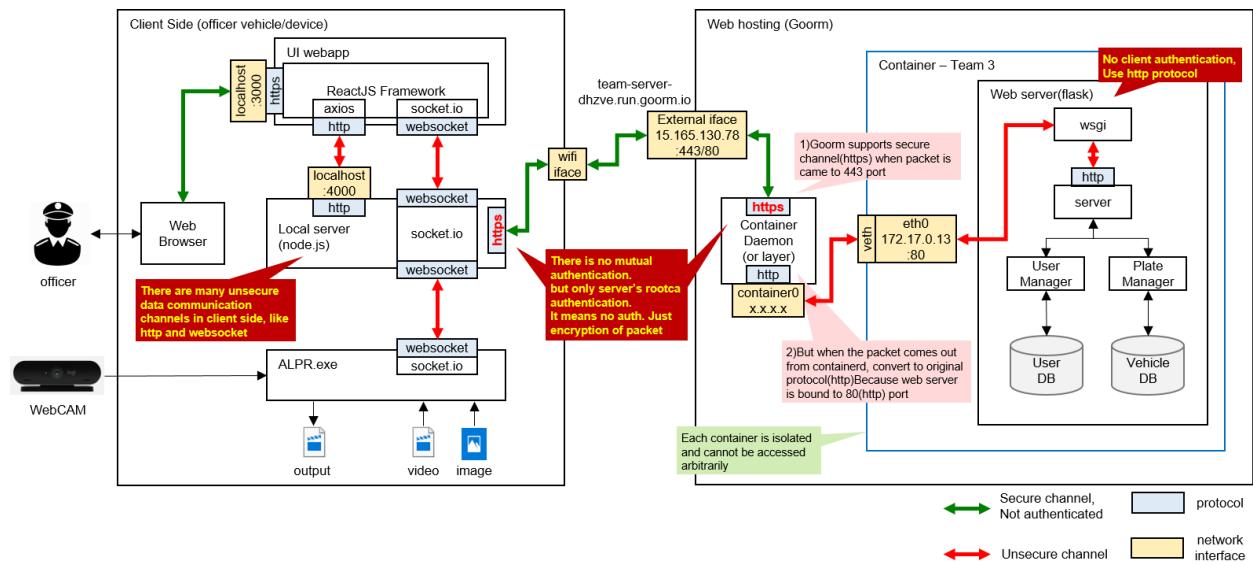

This section describes source code analysis and static analysis to discover vulnerabilities in Team Purple's ALPR system.

## 3.1 Architecture Analysis

We analyzed the design and source code of Team 3's and drew the detailed architecture again.

Through this process, the interface and protocol used for communication between each component were identified, and whether it was a secure channel or not was determined.

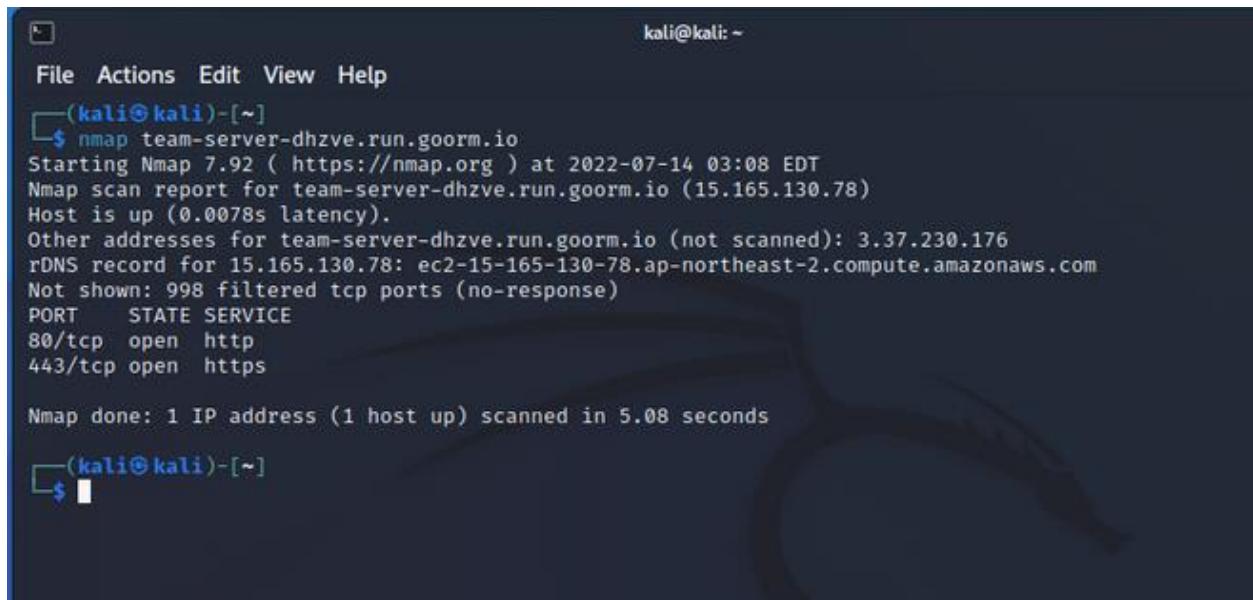

Based on this, we found the point and method to attack, and evaluated impact it had on the system by actually performing the attack.

- Pros
  - Remote web server is protected by container isolation  
→ container protects data and prevents from illegal access
- Cons
  - On client side, there are many unsecured data communication channel (http, websocket)  
→ Packets are easily sniffed by packet capturing tool
  - Web server use http protocol natively, and packets are wrapped with https (it is supported by Groom hosting service)  
→ There is no authentication of server/client, it means that it is vulnerable to spoofing

## 3.2 Reconnaissance

- target : team-server-dhzve.run.goorm.io (remote server)
- there are two ports 80(http), 443(https)

The screenshot shows a terminal window titled 'File Actions Edit View Help' with the command '(kali㉿kali)-[~]'. The user runs 'nmap team-server-dhzve.run.goorm.io' and receives the following output:

```
Starting Nmap 7.92 ( https://nmap.org ) at 2022-07-14 03:08 EDT
Nmap scan report for team-server-dhzve.run.goorm.io (15.165.130.78)
Host is up (0.0078s latency).
Other addresses for team-server-dhzve.run.goorm.io (not scanned): 3.37.230.176
rDNS record for 15.165.130.78: ec2-15-165-130-78.ap-northeast-2.compute.amazonaws.com
Not shown: 998 filtered tcp ports (no-response)
PORT      STATE SERVICE
80/tcp    open  http
443/tcp   open  https

Nmap done: 1 IP address (1 host up) scanned in 5.08 seconds
```

The terminal ends with '(kali㉿kali)-[~]' and a dollar sign '\$'.

Figure 22 Result of Reconnaissance

### 3.3 Static Analysis

In Team 3's System, most of the assets are located in the Server, and the Server is web-based.

They designed a system similar to that used in commercial servers and developed mainly using JavaScript, so we could not use tools such as Flawfinder or Cppcheck, which are often used for static analysis of C/C++ source code.

We checked for known vulnerabilities in the source code using tools called DeepScan and sonatypelift.

#### 3.3.1 DeepScan

- ✓ 6 issues, Poor grade

The screenshot displays six separate DeepScan findings, each with a code snippet and a detailed description:

- Variable 'videoView' is null checked here, but its property is accessed without null check afterwards at line 75.**  
source/client/web/src/components/dashboard/video\_view.js (45:32-45:10)  
42 }  
43 return (  
44 <Card {...props}>  
45 {startStop === "stop" || videoView === null ?  
46 <CardHeader
- Imported binding 'useState' is not used.**  
source/client/web/src/components/dashboard-layout.js (1:10-1:18)  
1 import { useState } from 'react';  
2 import { Box } from '@mui/material';
- Value assigned to variable 'port' at this point is not used afterwards.**  
source/client/web/src/images/server.js (216:9-216:13)  
213  
214 server.listen(4000, function () {  
215 var host = server.address().address  
216 var port = server.address().port  
217 })
- Value assigned to variable 'host' at this point is not used afterwards.**  
source/client/web/src/images/server.js (215:9-215:13)  
212 });  
213  
214 server.listen(4000, function () {  
215 var host = server.address().address  
216 var port = server.address().port
- Function 'getFrameData' defined at line 81 takes only 1 argument, but it is called with 2 arguments at this point.**  
source/client/web/src/images/server.js (51:28-51:30)  
48 );  
49  
50 socket.on('cameraView', (message, callback) => {  
51 getFrameData(true, message);  
52 })
- Value assigned to variable 'host' at this point is not used afterwards.**  
source/client/web/src/images/server.js (215:9-215:13)  
212 );  
213  
214 server.listen(4000, function () {  
215 var host = server.address().address  
216 var port = server.address().port
- Function takes only 1 argument, but it is called with 2 arguments at this point.**  
source/client/web/src/images/server.js (51:28-51:30)  
48 );  
49  
50 socket.on('cameraView', (message, callback) => {  
51 getFrameData(true, message);  
52 })

Figure 23 Result of DeepScan

### 3.3.2 sonatypelift

- ✓ 15 issues (8 critical / 7 severe)
- ✓ 13 components Violation

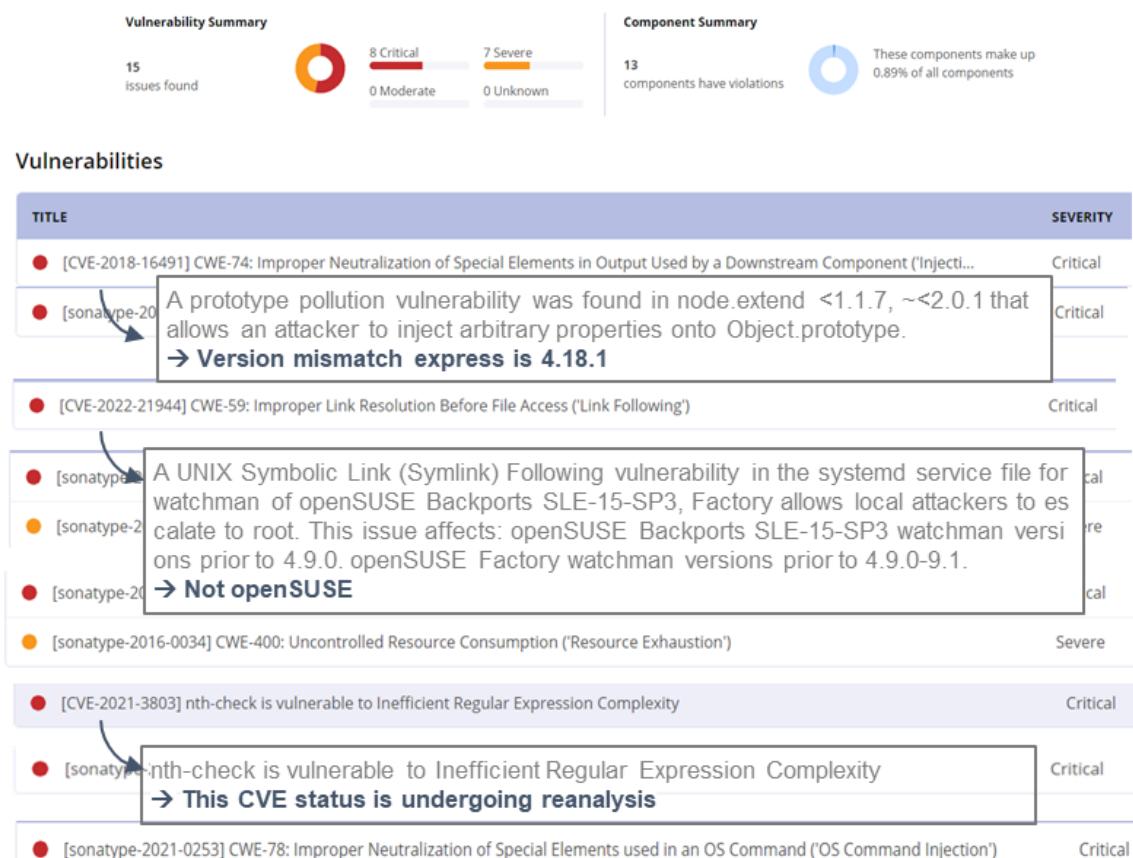

Figure 24 Result of sonatypelift

## 3.4 Fuzzing Test

### 3.4.1 Testing of Rest API using ZAP

We could not find any critical issue is Fuzz

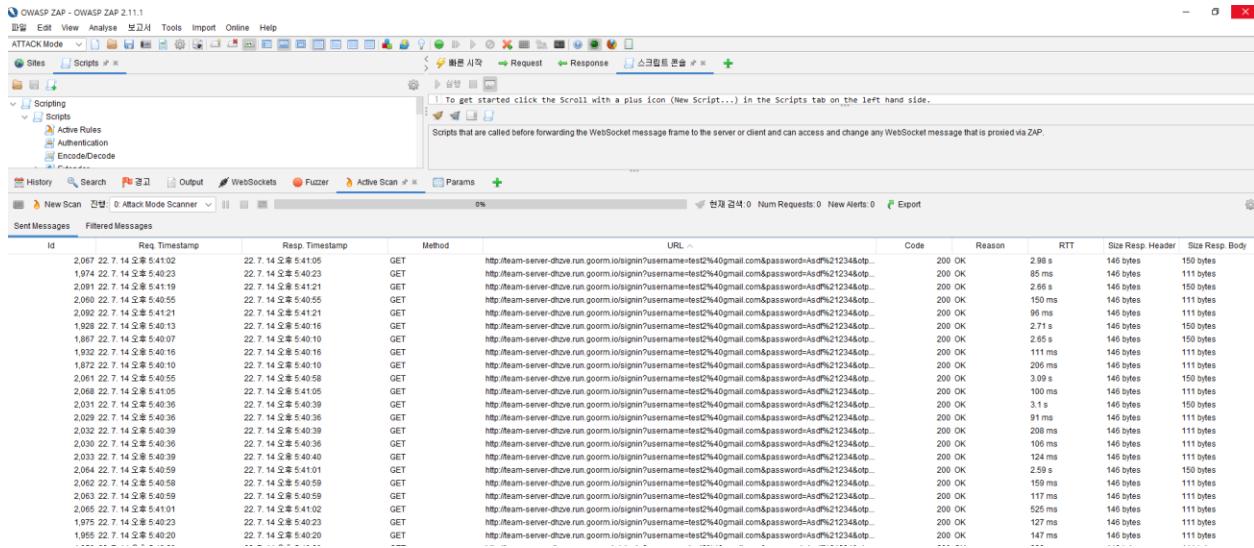

Figure 25 Result of Fuzz - login API

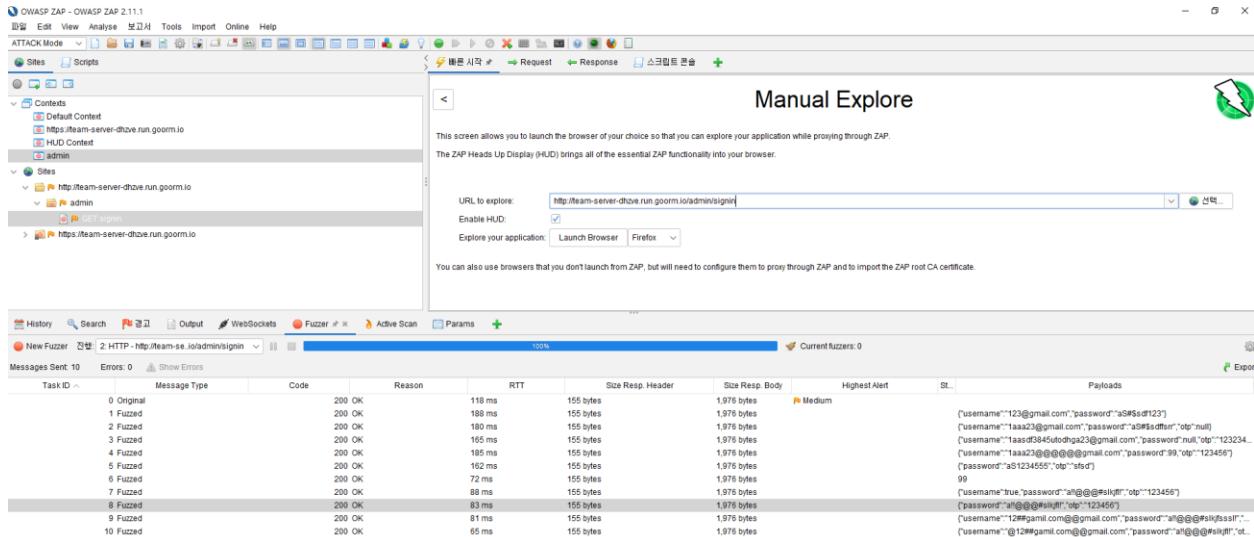

Figure 26 Result of Fuzz - admin login API

# 4 Vulnerability Analysis

---

This section describes

## 4.1 Analysis Criteria

### 4.1.1 Security Properties

- [CONFIDENTIALITY] - compromises confidentiality
- [INTEGRITY] - compromises integrity
- [AVAILABILITY] - compromises availability

### 4.1.2 Approach (What we did to find the vulnerability)

manual

- | [REVIEW/CODE] - done by reviewing code itself
- | [REVIEW/DESIGN] - done by reviewing documents or code
- | [FUZZING] - done by running fuzzing tools
- v [STATIC] - done by running static analysis tools

toolly

### 4.1.3 Attack vector (pathway, what attacker obtained)

high opportunity

- | [SERVERINFO] - can attack only with server ip, port
- | [NETWORK] - can attack over the network communicating
- | [CLIENT/ACCESS] - can attack with client accessible
- | [CLIENT/SOURCE] - can attack with client source exposed
- | [CLIENT/PRIVILEGED] - can attack with client accessible with privileged
- | [SERVER/ACCESS] - can attack with server accessible
- v [SERVER/SOURCE] - can attack with server source exposed

low opportunity

### 4.1.4 Exploit Techniques

- [SQLINJECTION] - for by-passing authentication
- [BUFFEROVERFLOW] - reading or writing beyond legitimate area
- [WRAPAROUND] - making use of unsinged type wraparound
- [FORMATSTRING] - mainly used for leaking data on the stack
- [REVEALEDKEY] - decrypting secure data using revealed keys
- [SNIFFING] - sniffing packets over the network
- [SPOOFING] - so-called, man in the middle attack
- [BRUTEFORCE] - trying all possible input until success
- [CRAFTPACKET] - crafting and sending a customized packet
- [TAMPERING] - modifying system components for a purpose
- [WEBDEBBER] - sniffing credentials using web debugger.
- [NOSPECIFIED] - no special techniques specified

## 4.2 Vulnerability Analysis

### 4.2.1 Vulnerability List

**Table 60 Vulnerability List**

STRIDE	VID	vulnerabilities	
		Client side	Server side
<b>Spoofing</b>	V08, V11, V13, V15, V16, V18, V22, V23, V24, V25, V26	<ul style="list-style-type: none"> <li>Server connection and plate information inquiry are possible with an spoofing client app (ex. jwt token)</li> <li>using phishing of fake client web site, get a user credential</li> <li>Available to change https to http by tempering the client's server.js file.</li> </ul>	<ul style="list-style-type: none"> <li>An attacker can retrieve plate information with a newly added user account by the stolen administrator credentials.</li> <li><b>Remote server spoofing available</b> <ul style="list-style-type: none"> <li>The external server provided by goorm does not support mutual authentication using tls based on pki.</li> </ul> </li> </ul>
<b>Tampering</b>	V12, V13, V25, V26, V27	<ul style="list-style-type: none"> <li>A TOCTOU attack is possible because there is a time gap between file selection and file playback</li> </ul>	<ul style="list-style-type: none"> <li>Illegal user account can be added by obtaining administrator privileges(ex. Admin cookie).           <ul style="list-style-type: none"> <li>- team-server-dhzve.run.goorm.io/admin/signup</li> </ul> </li> </ul>
<b>Repudiation</b>	V14, V21, V25, V26		<ul style="list-style-type: none"> <li>no log records for login or logout with an administrator or general account</li> </ul>
<b>Information Disclosure</b>	V01, V02, V03, V05, V06, V07, V09, V10, V15, V17, V18, V19, V20, V22, V23, V24, V25, V26	<ul style="list-style-type: none"> <li>User Credentials are disclosure by wireshark sniffing or web debugger tool, User Interface - UserName, Password, OTP, Token, Plate Information</li> </ul>	<ul style="list-style-type: none"> <li>User names and OTP seeds are disclosure by anonymously accessible API           <ul style="list-style-type: none"> <li>"team-server-dhzve.run.goorm.io/admin/log"</li> <li>"team-server-dhzve.run.goorm.io/auth/&lt;user&gt;"</li> </ul> </li> <li>Admin cookie is disclosure by wireshark sniffing or web debugger tool</li> </ul>
<b>DoS</b>	V04	<ul style="list-style-type: none"> <li>App crash due to non input validation</li> </ul>	
<b>Elevation of Privilege</b>	V11, V12, V13, V16,	<ul style="list-style-type: none"> <li>User privileges can be obtained by using token</li> </ul>	<ul style="list-style-type: none"> <li>Administrator privileges can be obtained by below API           <ul style="list-style-type: none"> <li>- team-server-dhzve.run.goorm.io/admin/signin</li> </ul> </li> </ul>

### 4.2.2 Recommended Mitigations

**Table 61 Recommended Mitigations**

STRIDE	VID	vulnerabilities	
		Consequences / Impact	Recommendations
<b>Spoofing</b>	V08, V11, V13, V15, V16, V18, V22, V23, V24, V25, V26	<ul style="list-style-type: none"> <li>An attacker can acquire the plate information</li> <li>An Attacker can add new account arbitrarily</li> <li>An attacker can steal admin or general account information by fake client app</li> <li>An attacker can steal admin or general account information by fake remote server using DNS spoofing</li> <li>An attacker can sniff all information by changing HTTPS to HTTP by tampering with the internal server of the client app</li> </ul>	<ul style="list-style-type: none"> <li>Using the PKI with SSL/TLS</li> <li>Using JWT token revoke mechanism</li> <li>No multiple access with one account</li> </ul>
<b>Tampering</b>	V12, V13, V25, V26, V27	<ul style="list-style-type: none"> <li>An attacker can pollute the user db by adding illegal users</li> <li>An attacker can be possible to disturb normal plate inquiry by replacing the plate image</li> </ul>	<ul style="list-style-type: none"> <li>Using the PKI with SSL/TLS</li> <li>Using ACLs/permissions</li> </ul>
<b>Repudiation</b>	V14, V21, V25, V26	<ul style="list-style-type: none"> <li>The attacker accesses the server with the stolen account, but the server does not record. So, it is impossible to track the attacker</li> </ul>	<ul style="list-style-type: none"> <li>Logging</li> </ul>
<b>Information Disclosure</b>	V01, V02, V03, V05, V06, V07, V09, V10, V15, V17, V18, V19, V20, V22, V23, V24, V25, V26	<ul style="list-style-type: none"> <li>An attacker can steal general user credentials such as user name, password, otp seed, token and use this credentials to acquire the plate information</li> <li>An attacker can steal Administrator's credentials such as admin name, password, otp seed, cookie and use this admin credentials to add new illegal account</li> </ul>	<ul style="list-style-type: none"> <li>Minimize interfaces that can expose information disclosure</li> <li>Provide the client interface in the form of WebApp.           <ul style="list-style-type: none"> <li>- Eliminate exposed IPC channels by operating in one process</li> <li>- Block external web debug tools at the WebApp level</li> <li>- Add access permissions to the API provided to the administrator</li> <li>- Using Javascript Obfuscation technology</li> </ul> </li> </ul>
<b>DoS</b>	V04	<ul style="list-style-type: none"> <li>An attacker can disable the use of the client app</li> </ul>	<ul style="list-style-type: none"> <li>Check to input validation on the client side</li> <li>Using file input filters</li> </ul>
<b>Elevation of Privilege</b>	V11, V12, V13, V16,	<ul style="list-style-type: none"> <li>An attacker can acquire the plate information</li> <li>An Attacker can add new account arbitrarily</li> </ul>	<ul style="list-style-type: none"> <li>Eliminate account information disclosure by using role based access controls for server API.</li> <li>Minimize attackable URLs such as "team-server-dhzve.run.goorm.io/auth/&lt;user&gt;"</li> <li>When the number of failed logins is exceeded, the account is locked</li> </ul>

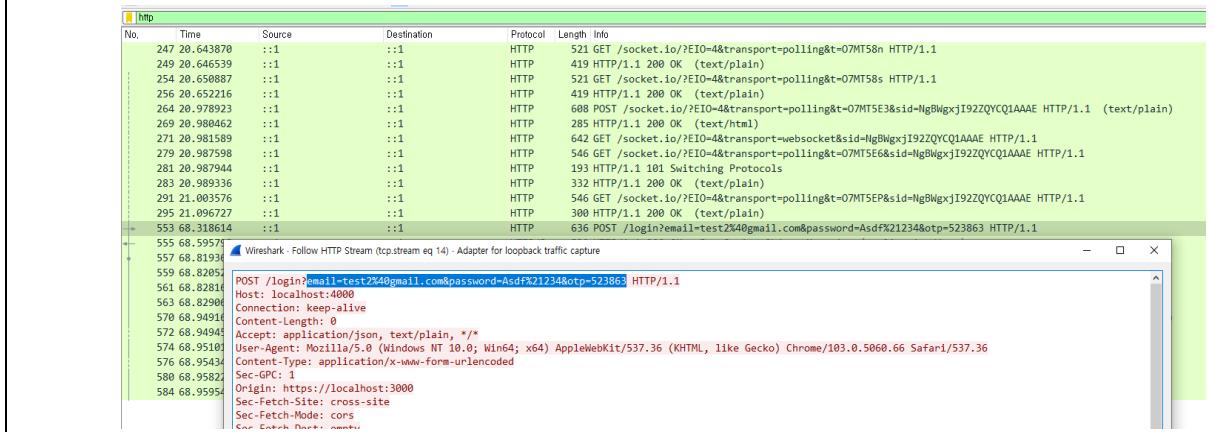

### 4.2.3 V01 - UI Webapp in client side send user credential as raw string, not encrypted

Table 62 Vulnerability - V01

Description	[V01] UI Webapp in client side send user credential as raw string, not encrypted																		
CIA	[CONFIDENTIALITY]	Attack vector	[CLIENT/ACCESS]																
Approach	[REVIEW/DESIGN]	Exploit technique	[SNIFFING]																
Vulnerabilities																			
<ol style="list-style-type: none"> <li>1. In client side, there are three parts; webapp for UI, local nodejs server and ALPR</li> <li>2. To communicate between webapp UI and local server, HTTP which is not secured channel is used</li> <li>3. It causes information disclosure, because data is not encrypted</li> </ol> <pre> graph TD     subgraph Client [Client]         direction TB         C1[webpack-dev-server] -- "ReactJS" --&gt; C2[axios(http)]         C1 -- "ReactJS" --&gt; C3[socket.io-client]     end     subgraph InternalServerSide [Internal Server Side]         direction TB         I1[NodeJS] -- "HTTPS" --&gt; I2[HTTP]         I1 -- "socket.io" --&gt; I3[socket.io]     end     subgraph ALPRLibSide [ALPR Lib Side]         direction TB         A1[ALPR] -- "socket.io-client-cpp" --&gt; A2[socket.io-client-cpp]     end     C2 -- "unsecure channel" --&gt; I2     C3 --&gt; I3     I2 --&gt; A2     I3 --&gt; A2 </pre>																			
CVSS Score	7.9	Severity	High																
<b>Common Vulnerability Scoring System Calculator</b> <p>This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.</p> <table border="1"> <thead> <tr> <th>Score Type</th> <th>Score Value</th> </tr> </thead> <tbody> <tr> <td>CVSS Base Score</td> <td>6.5</td> </tr> <tr> <td>Impact Subscore</td> <td>3.6</td> </tr> <tr> <td>Exploitability Subscore</td> <td>2.8</td> </tr> <tr> <td>CVSS Temporal Score</td> <td>6.2</td> </tr> <tr> <td>CVSS Environmental Score</td> <td>7.9</td> </tr> <tr> <td>Modified Impact Subscore</td> <td>5.4</td> </tr> <tr> <td>Overall CVSS Score</td> <td>7.9</td> </tr> </tbody> </table> <p>CVSS v3.1 Vector AV:N/AC:L/PR:L/UI:N/S:U/C:H/I:N/A:N/E:P/RL:X/RC:C/CR:H/IR:L/AR:L/MAV:N/MAC:L/MPR:L/MUI:N/MS:U/MC:H/MI:N/MA:N</p>				Score Type	Score Value	CVSS Base Score	6.5	Impact Subscore	3.6	Exploitability Subscore	2.8	CVSS Temporal Score	6.2	CVSS Environmental Score	7.9	Modified Impact Subscore	5.4	Overall CVSS Score	7.9
Score Type	Score Value																		
CVSS Base Score	6.5																		
Impact Subscore	3.6																		
Exploitability Subscore	2.8																		
CVSS Temporal Score	6.2																		
CVSS Environmental Score	7.9																		
Modified Impact Subscore	5.4																		
Overall CVSS Score	7.9																		
Consequence / Impact analysis																			
<p>The officer's credential is not only for ALPR service. It may be SSO(Single Sign On) account for police office. So, this officer's credential can be used for following attack like penetrate police office server and connect to police office portal and then steal target data and so on. In addition, store this user credential and use this for another site's dictionary attack. Because people sometimes use same ID/PW on various site. Also, attacker can sell user credential to illegal group and make money</p>																			
Recommended mitigation																			
Use secure communication channel protocol like HTTPS(above TLS version 1.2) between module, instead of HTTP																			

Tools needed	Wireshark(Packet capture)

Proof of concept / How to attack	
<p>Constraints:</p> <ul style="list-style-type: none"> <li>- Attacker can access client device and run Wireshark for packet capturing</li> </ul> <p>Procedure:</p> <ol style="list-style-type: none"> <li>1. Run Wireshark for capturing packets and bind to localhost</li> <li>2. Connect to officer UI webpage(<a href="https://localhost:3000">https://localhost:3000</a>)</li> <li>3. Attempt to login with ID/PW/OTP which are provided</li> </ol>	

#### 4. Check that user credential is not encrypted(HTTP Protocol) in Wireshark

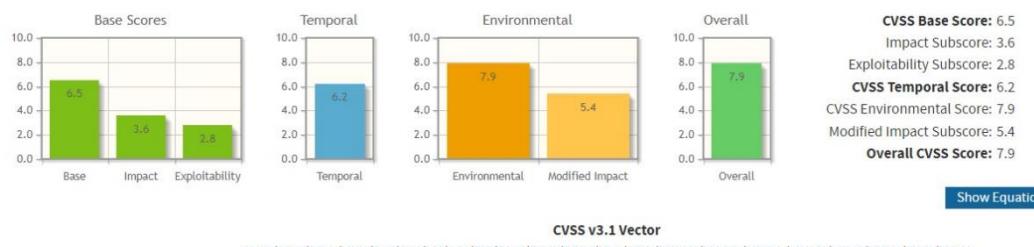

#### 4.2.4 V02 - Privacy is exposed in vehicle registration information

**Table 63 Vulnerability - V02**

Description	[V02] Privacy is exposed in vehicle registration information		
CIA	[CONFIDENTIALITY]	Attack vector	[CLIENT/ACCESS]
Approach	[REVIEW/DESIGN]	Exploit technique	[SNIFFING]
<b>Vulnerabilities</b>			
<ol style="list-style-type: none"> <li>In client side, there are three parts; webapp for UI, local nodejs server and ALPR</li> <li>To communicate between webapp UI and local server, websocket which is not secured channel is used</li> <li>It causes information disclosure, because data is not encrypted</li> </ol>			
CVSS Score	7.9	Severity	High

#### Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

## Consequence / Impact analysis

From vehicle registration, privacy is exposed and stolen by attacker. Attack can know vehicle user's home address and abuse for criminal. Also, attacker can sell privacy to illegal group and make money

## Recommended mitigation

Use WSS(WebSockets over SSL/TLS) for secure data communication channel instead of websocket

Tools needed	Wireshark(Packet capture)
--------------	---------------------------

## Relative component / source code

### Local Server / UI webapp

```
client/web/src/images/server.js
115 if(plateArr.length === 0 || !plateArr.includes(_data[1])){
116     plateArr.push(_data[1]);
117     const request = https.request(host+ "/plate/get?plate_number="+_data[1], options, (response) => {
118         let data = '';
119         response.on('data', (chunk) => {
120             data = data + chunk.toString();
121         });
122     });
123     response.on('end', () => {
124         try{
125             const body = JSON.parse(data);
126             io.to(socketId).emit('queryTimeout', '');

73     let result = message;
74     let data = result.result;
75
76     if(data.status !== "fail"){
77         setPlateInfo(oldArr => [data, ...oldArr]);
78     } else {
79         if(data.message === "Invalid token"){
80             alert(data.message + ". Please signin again.");
81             sessionStorage.clear();
82             setJwt("");
83             window.location.reload();
84         }
85     }
86 });

```

## Proof of concept / How to attack

### Constraints:

- Attacker can access client device and run Wireshark for packet capturing

### Procedure:

1. Run Wireshark for capturing packets and bind to localhost
2. Connect to officer UI webpage(<https://localhost:3000>)
3. Attempt to login with ID/PW/OTP which are provided
4. Start ALPR service by opening video file "beaver1.avi" and clicking "START ALPR"

5. Check that vehicle registration info is not encrypted(WebSocket Protocol) in Wireshark							

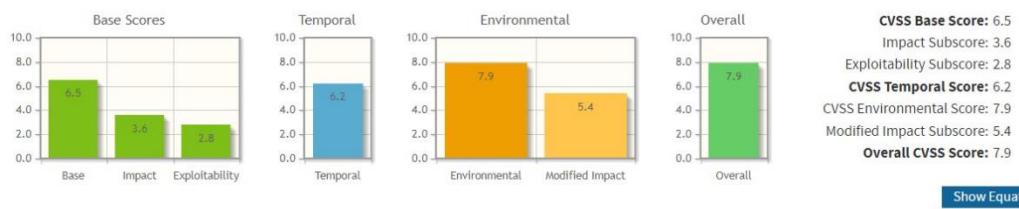

#### 4.2.5 V03 - User credentials are exposed to URL params due to using the 'GET' method.

Table 64 Vulnerability - V03

Description	[V03] User credentials are exposed to URL params due to using the 'GET' method.		
CIA	[CONFIDENTIALITY]	Attack vector	[NETWORK]
Approach	[REVIEW/CODE]	Exploit technique	[SNIFFING]
<b>Vulnerabilities</b>			
Using 'Get' method for login API.  "https://team-server-dhzve.run.goorm.io/signin?username=test2@gmail.com&password=Asdf!234&otp=932468"			
<b>Relative component / source code</b>			
CVSS Score	7.9	Severity	High

#### Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

#### Consequence / Impact analysis

an attacker can steal user credentials such as user name, password, otp seed.

using this information, an attacker can acquire the plate information.

#### Recommended mitigation

Use "POST" method instead of "GET" method in login process.

Tools needed Postman

#### Proof of concept / How to attack

##### 1. server.js

```
app.post('/login', function(req, res){
  let email = req.query.email;
  let password = req.query.password;
  let otp = req.query.otp;

  const url = host + "/signin?username=" + email + "&password=" + password + "&otp=" + otp;
  const request = https.request(url, (response) => {
    let data = '';
    response.on('data', (chunk) => {
      data = data + chunk.toString();
    });
  });
});
```

##### 2. server.py

```
user_management = Blueprint('usermanagement', __name__, url_prefix='/')

@user_management.route("/signin", methods=['GET', 'POST'])
def signin():
    if request.method == 'GET':
        form_user = request.args.get("username")
        form_pass = request.args.get("password")
        form_otp = request.args.get("otp")
    else:
        form_user = request.form.get("username")
        form_pass = request.form.get("password")
        form_otp = request.form.get("otp")
```

##### 3. Run Postman

##### 4. make Headers & Params

##### 5. send packet to server

[https://team-server-](https://team-server-dhzve.run.goorm.io/)

[dhzve.run.goorm.io/signin?username=test2@gmail.com&password=Asdf!234&otp=932468](https://team-server-dhzve.run.goorm.io/signin?username=test2@gmail.com&password=Asdf!234&otp=932468)

### 4.2.10 V08 - Attacker can inject a fake play-back to officer's browser

Table 69 Vulnerability - V08

Description	[V08] Attacker can inject a fake play-back to officer's browser		
CIA	INTEGRITY	Attack vector	CLIENT/ACCESS
Approach	MANUAL	Exploit technique	SPOOFING
Vulnerabilities			
Attacker can inject malicious playback file instead of normal playback file.			
Relative component / source code			
Local Server, ALPR.exe, UI webapp			
CVSS Score	7.9	Severity	High

## Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

Show Equations

### Consequence / Impact analysis

An attacker can use the corrupted file to deceive the officer.

### Recommended mitigation

Change design of the interface between local server and alpr.exe

(ALPR.exe instance should be corresponded to UI webapp with 1:1 manner.)

Tools needed

NA

### Proof of concept / How to attack

#### Pre-Condition

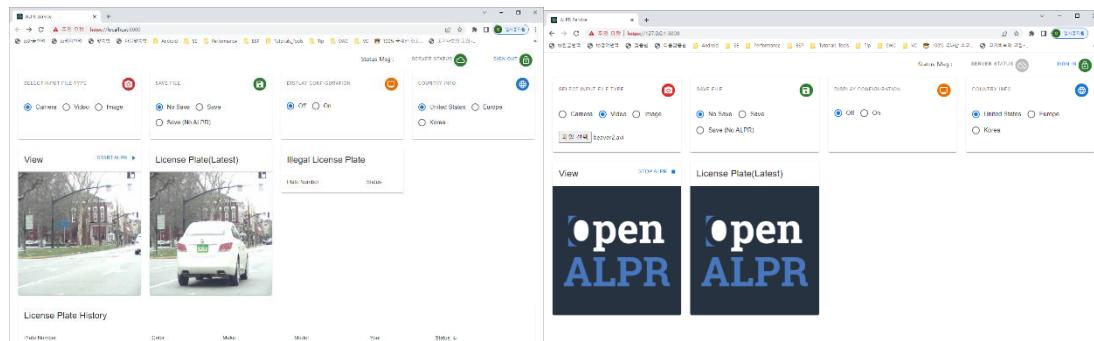

- Officer did log-in normally.

#### Procedure

- Attacker executes another browser.
- Attacker accesses local client's server : "https://127.0.0.1:3000"
- Attacker selects playback file with skipping log-in.
- Attacker clicks "START ALPR."
- Playback file selected by attacker is played on officer's browser and corresponding vehicle information are displayed also.

- Officer's browser

- Attacker's browser

### Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

#### Consequence / Impact analysis

1. an attacker accesses the server with the stolen admin's account information and gets a admin's cookie from server.
2. Using this information, an attacker can add new illegal account.

#### Recommended mitigation

1. Add access permissions to the API provided to the administrator.
2. Minimize attackable URLs such as "team-server-dhzve.run.goorm.io/auth/<user>"
3. Block repeated failed login attempts for a certain period of time
4. When the number of failed logins is exceeded, the account is locked.

Tools needed	Brutus Password Cracker
--------------	-------------------------

#### Proof of concept / How to attack

1. to get admin's username and password from login's URL params or chrome inspector or sniff the client.
2. to get otp seeds form  
<https://team-server-dhzve.run.goorm.io/auth/lg2.3team@gmail.com>
3. enter "https://team-server-dhzve.run.goorm.io/admin/signin"  
- otp seed : "GNPDDQVSOSVMFTC2YIWVSSKMU4FYOJQF"
4. input Username : "lg2.3team@gmail.com" and Password: "qwer!234", OTP number : "xxxxxx"

The screenshot shows a web application interface. At the top, there is a header bar with various links: OpenGrok, Gerrit, AndroidDev, Inspect, Firebase, Kibana, Kibana-Test, Zeplin, Json Parser, ALM, and Google. Below this is a navigation bar with links: Not secure | team-server-dhzve.run.goorm.io/admin/page, OpenGrok, Gerrit, AndroidDev, Inspect, Firebase, Kibana, Kibana-Test, Zeplin, and Json.

The main content area contains two sections:

- Admin SignIn**: A form with three fields: "Username" (placeholder: Your username), "Password" (placeholder: Your password), and "OTP number" (placeholder: Your OTP number). A blue "LOGIN" button is located below the fields.
- Admin Page**: A page with a header "Admin Page" and a navigation bar with links: User SignUp, Log, and Logout.

#### 4.2.14 V12 - Any user account can be added by obtaining administrator privileges

Table 73 Vulnerability - V12

Description	[V12] Any user account can be added by obtaining administrator privileges (admin login or stolen cookie)

※ In the CVSS Scoring system, impact is judged only from a CIA perspective.

※ Non-repudiation vulnerabilities have a limit that impact cannot be calculated.

#### Consequence / Impact analysis

An attacker accesses the server with the stolen account, but the server does not record. So, it is impossible to track the attacker.

#### Recommended mitigation

Logging

Tools needed

NA

#### Proof of concept / How to attack

### 4.2.17 V15 - An attacker can retrieve plate information with a newly added user account by the stolen administrator account

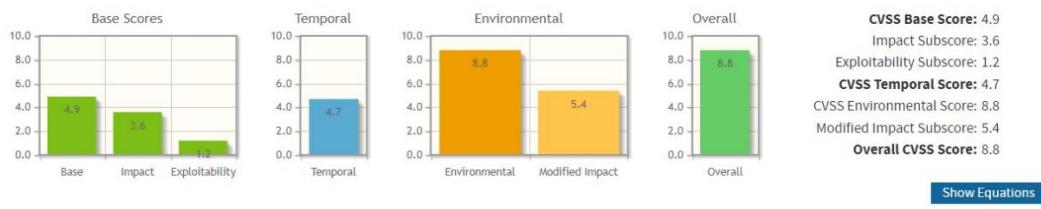

Table 76 Vulnerability - V15

Description	[V15] An attacker can retrieve plate information with a newly added user account by the stolen administrator account.

Approach	[REVIEW/CODE]	Exploit technique	[CRAFTPACKET] [SPOOFING]
<b>Vulnerabilities</b>			
Attacker can add new user account.			
Relative component / source code			
CVSS Score	8.8	Severity	High

### Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

### Consequence / Impact analysis

An attacker can acquire the plate information

An Attacker can add new account arbitrarily

### Recommended mitigation

1. Use trusted device and user authentication using the PKI with SSL/TLS
2. Using Javascript Obfuscation technology
3. Strengthen the security of the OTP issuance process

Tools needed	Postman
--------------	---------

### Proof of concept / How to attack

1. The attacker adds user accounts according to V12.  
- wo0ngs@gmail.com is added
2. Login with account "wo0ngs@gmail.com"

3. We can obtain plate and license information by inquiring about any plate number.

#### 4.2.18 V16 - jwt token spoofed by an attacker

**Table 77 Vulnerability - V16**

Description	[V16] jwt token spoofed by an attacker		
CIA	[CONFIDENTIALITY]	Attack vector	[SERVER/ACCESS]
Approach	[REVIEW/CODE]	Exploit technique	[SPOOFING]
<strong>Vulnerabilities</strong>			
For the jwt token issued by the server, it is not stored in association with user information.			
Therefore, multiple logins with the same username are possible.			
and there is no logic to handle expired tokens by user logout.			
Also if the private key is exposed, it is impossible to validate the jwt token spoofed by an attacker on the server side because the issued jwt token format is simple.			
it is defending on the config._JWT_SECRET_KEY_ only.			
<strong>1. usermanagement.py</strong>			
<pre>@user_management.route("/signin", methods=['GET', 'POST']) def signin():     if request.method == 'GET':         form_user = request.args.get("username")         form_pass = request.args.get("password")         form_otp = request.args.get("otp")     else:         form_user = request.form.get("username")         form_pass = request.form.get("password")         form_otp = request.form.get("otp")      if form_user is None or form_pass is None or form_otp is None:         return {"result": [             "status": "fail",             "message": "Invalid signin info."         ]}      result, value = valid_username(form_user)     if not result:         return jsonify(value)      data = User.query.filter_by(username=form_user).first() # ID is query attribute     if data is not None:         if data.username == form_pass:             totp_instance = pyotp.TOTP(data.otp)             valid = totp_instance.verify(form_otp)             if valid:                 data.otprefresh = 0                 data.passwordrefresh = 0                  token = jwt.encode({'public_id': data.username, 'exp': datetime.datetime.utcnow() + datetime.timedelta(minutes=45)}, config._JWT_SECRET_KEY_, "HS256")                 value["result"] = {                     "status": "success",                     "token": token,                     "message": ""                 }             else:                 value["result"] = {                     "status": "fail",                     "message": "OTP verification failed"                 }         else:             value["result"] = {                 "status": "fail",                 "message": "Incorrect password"             }     else:         value["result"] = {             "status": "fail",             "message": "User not found"         }      return jsonify(value)</pre>			

## .utils.py

- the token is checked only for tampering without comparing the token stored in the server.

#### 4.2.19 V17 - Vulnerability of recovering user password

Table 78 Vulnerability - V17

Description	[V17] Vulnerability of recovering user password		
CIA	[CONFIDENTIALITY]	Attack vector	[SERVER/ACCESS]
Approach	[REVIEW/CODE]	Exploit technique	[BRUTEFORCE]
Vulnerabilities			
<p>If the password and OTP information are wrong 3 times or more, a new password is automatically sent to the account email without authentication.</p> <p>In addition, the new password is the value in which the old passwords are listed in reverse order. So, the original password and the new password appear repeatedly.</p> <p>Therefore, if the user's account email is exposed, the attacker could easily obtain a password and may be vulnerable to brute force attacks.</p>			
<p>- usermanagement.js</p> <pre>if data is not None:     if data.password == form_pass:         totp_instance = pyotp.TOTP(data.otp)         valid = totp_instance.verify(form_otp)         if valid:             data.otpcnt = 0             data.passwordcnt = 0             db.session.commit()             token = jwt.encode({'public_id': data.username, 'exp': datetime.datetime.utcnow() + datetime.timedelta(hours=1)}, value = ("result": {                 "status": "success",                 "token": token,                 "message": ""             }))         else:             data.otpcnt = data.otpcnt + 1             db.session.commit()      if data.passwordcnt + data.otpcnt &gt; 2:         password = data.password         data.password = password[::-1]         data.passwordcnt = 0         data.otpcnt = 0         db.session.commit()         smtplib(data.username, f"new password : {data.password}")         value = ("result": {             "status": "fail",             "token": "",             "message": f"A new password has been sent to you by backup e-mail({data.username})"         })     else:         value = ("result": {             "status": "fail",             "token": "",             "message": "invalid OTP or Password Number"         }) </pre>

### Consequence / Impact analysis

An attacker can try to steal admin or user account using brute force attacks.

### Recommended mitigation

When the number of failed logins is exceeded, the account is locked.

Tools needed	brute force attacks
--------------	---------------------

### Proof of concept / How to attack

1. password invalid two times.

The screenshot shows a login interface with the following elements:

- A message box at the top left: "localhost:3000 내용:  
A new password has been sent to you by backup e-mail(test2@gmail.com)" with a "확인" button.
- Input fields below: "Email Address" with value "test2@gmail.com", "Password" with masked value ".....", and "OTP" with masked value ".....".
- A large blue "SIGN IN NOW" button at the bottom.

2. repeat password invalid two times.

3. input same password and valid otp

4. login successful

### 4.2.20 V18 - An attacker can retrieve plate information with a stolen jwt token.

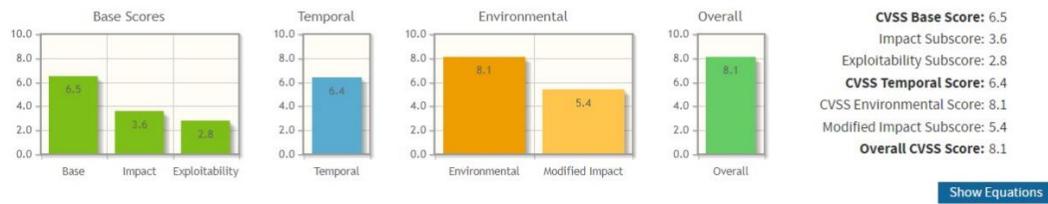

Table 79 Vulnerability - V18

Description	[V18] An attacker can retrieve plate information with a stolen jwt token.		
CIA	[CONFIDENTIALITY]	Attack vector	[SERVER/ACCESS]

Approach	[REVIEW/CODE]	Exploit technique	[CRAFTPACKET] [SPOOFING]
Vulnerabilities			
An attacker can retrieve plate information with a stolen jwt token.			
If a jwt token is stolen, it cannot be dealt with until it expires.			
1.server.js			
<pre>function getFrameData(query){     var jwt = query.jwt;     var executablePath = path.resolve('alpr.exe');     var parameters = ["-c", query.ct, "-s", query.save, "-f", query.res];      if(query.type === "camera"){         parameters.push(query.name);     } else if(query.type === "video"    query.type === "image"){         parameters.push(path.resolve(query.name));     }      if(pid === 0){         var cmd = executablePath + " " + parameters.join(" ");         const child = exec(cmd, (error, stdout, stderr) =&gt; {             if (error) {                 ...             }         });          pid = child.pid;         child.stdout.on('data', (data) =&gt; {             if(data.includes("plate")){                 let _data = data.split(",");                 try{                     if(_data[1] !== null &amp;&amp; _data[2] !== null &amp;&amp; _data[2] &gt;= 90){                         if(jwt !== null){                             var options = {                                 timeout: 10000,                                 time: true,                                 headers: {                                     'Content-Type': 'application/json',                                     'Authorization': `Bearer \${jwt}`                                 }                             };                         }                 </pre>			
2. platequery.py			
<pre>@plate_query.route("/get", methods=['GET']) @token_required def getPlate(valid_user):     if valid_user is not None:          plate_number = request.args.get('plate_number')          if plate_number is None:             value = {"result": {"status": "fail",                                "message": "Invailed plate number"}}             return jsonify(value)          result, value = valid_platenumber(plate_number)         if not result:             return jsonify(value)          data = Plate.query.filter_by(plate=plate_number).first()</pre>			
3. the token is the only access right to the API.			
4. After logout of the client app, the token is still valid on the server side.			
- index.js : only clear client side's token			
<pre>const signOut = () =&gt; {     sessionStorage.clear();     setJwt(sessionStorage.getItem("key")); }</pre>

## Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

Consequence / Impact analysis

An attacker can steal general user credentials such as user name, password, otp, token and use its credentials to acquire the plate information

Recommended mitigation

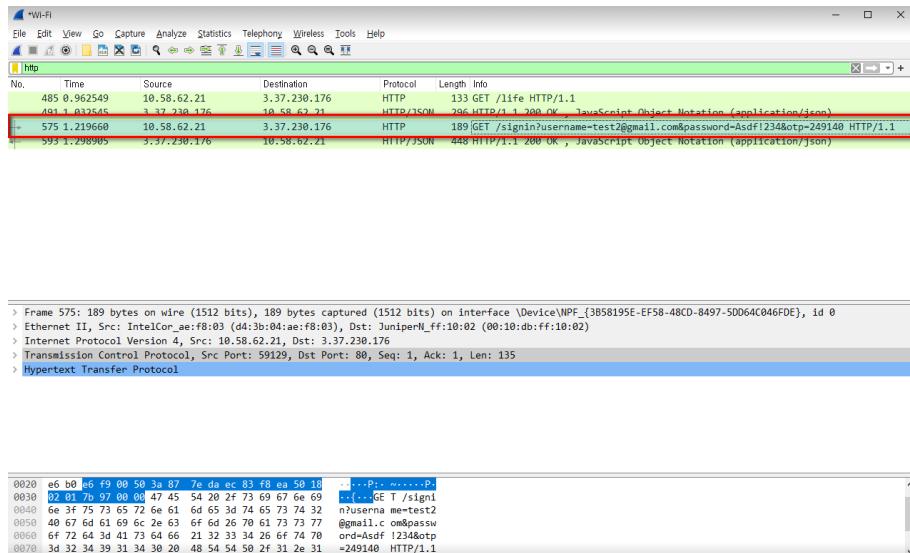

1. Using JWT token revoke mechanism
2. Use “POST” method instead of “GET” method in login process.

Tools needed

Wireshark

<pre>usermanagement.py - no log  @user_management.route("/signin", methods=['GET', 'POST']) def signin():     if request.method == 'GET':         form_user = request.args.get("username")         form_pass = request.args.get("password")         form_otp = request.args.get("otp")     else:         form_user = request.form.get("username")         form_pass = request.form.get("password")         form_otp = request.form.get("otp")      if form_user is None or form_pass is None or form_otp is None:         return {"result": "fail",                 "status": "fail",                 "message": "Invalid signin info."}     else:         result, value = valid_username(form_user)         if not result:             return jsonify(value)          data = User.query.filter_by(username=form_user).first() # ID ==Query ==          if data is not None:             if data.password == form_pass:                 toto_instance = pyotp.TOTP(data.otp)                 valid = toto_instance.verify(form_otp)                 if valid:                     data.passwordcnt = 0                     db.session.commit()                     token = jwt.encode({'public_id': data.username, 'exp': datetime.datetime.utcnow() + datetime.timedelta(minutes=45)}, config._JWT_SECRET_KEY_, "HS256")                     value = {"result": "success",                             "status": "success",                             "token": token,                             "message": ""}             else:                 value = {"result": "fail",                         "status": "fail",                         "message": "Incorrect password."}      return jsonify(value)</pre>	

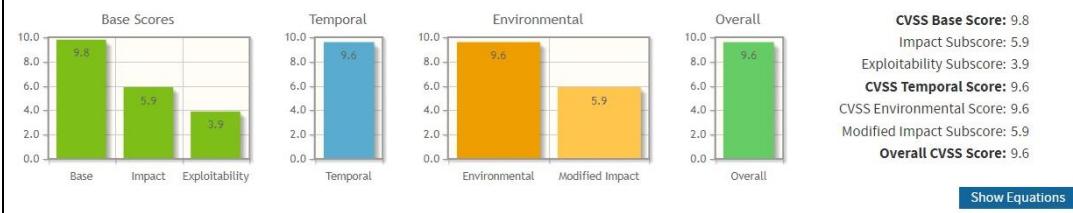

#### 4.2.24 V22 - Remote server spoofing

Table 83 Vulnerability - V22

Description	[V22] Remote server spoofing		
CIA	[Availability] [Confidentiality]	Attack vector	[NETWORK]
Approach	[REVIEW/DESIGN]	Exploit technique	[SPOOFING]
Vulnerabilities			
<ol style="list-style-type: none"> <li>1. Local server in client side and remote server do not proceed with mutual authentication.</li> <li>2. The remote server is implemented with http, but Goorm hosting service(COTS) supports https(TLS) when packet is came into 443 port. And convert to http packet because remote server in container is bounded at 80 port(HTTP). It means that client authentication is omitted</li> <li>3. Local server uses HTTPS/TLS1.2, but dose not authenticate server's certificate, just verify root CA of server certificate if this certificate is issued from authorized agency. It means that there is no authentication of server identification and encrypt packet on external network only.</li> <li>4. If attacker can redirect remote server URL to attacker's URL/IP, server spoofing could be done without any additional procedure</li> </ol>			
CVSS Score	9.6	Severity	Critical

## Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H/E:F/RL:X/R:C:CR:H/IR:H/AR:H/MAV:N/MAC:L/MPR:N/MUI:N/MS:U/MC:H/MI:H/MA:H

### Consequence / Impact analysis

Spoofing server can occur stealing sensitive data (e.g. user credential) and it is sold to illegal group for making money or used for following attack. Secondly, officer cannot execute law enforcement. It means that ALPR service is completely down (all stop) as long as DNS spoofing is worked. It damages to police office(government) reputation critically.

### Recommended mitigation

Apply mutual authentication procedure between server and client like TLS(above 1.2)

Tools needed	Goorm hosting service
--------------	-----------------------

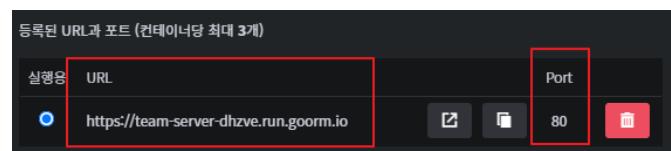

### Relative component / source code

#### Local Server in client side

(there is no additional authentication procedure or option, just request with https)

```
client/web/src/images/server.js
173 app.post('/login', function(req, res){
174   let email = req.query.email;
175   let password = req.query.password;
176   let otp = req.query.otp;
177
178   const url = host + "/signin?username="+email+"&password="+password+"&otp="+otp;
179   const request = https.request(url, (response) => {
180     let data = '';
181     response.on('data', (chunk) => {
182       data = data + chunk.toString();
183     });
184   });
185
186   request.end();
187
188   res.json({data});
189 });
190
191 module.exports = app;
```

### HTTPS converting service from Goorm hosting service

HTTP bind in remote server(server.py)

```

12 app = Flask(__name__)
13
14 if __name__ == '__main__':
15     app = Flask(__name__)
16     app.config['DEBUG'] = True
17     app.config['SQLALCHEMY_DATABASE_URI'] = config._DB_PATH_
18     app.config["SECRET_KEY"] = config._SESSION_SECRET_KEY_
19
20     db.init_app(app)
21     if not os.path.isfile('./server.db'):
22         with app.app_context():
23             db.create_all()
24             createdb()
25
26     app.register_blueprint(usermanagement.user_management)
27     app.register_blueprint(platequery.plate_query)
28
29     app.run(host='0.0.0.0', port=80)
30

```

## Proof of concept / How to attack

### Constraints:

1. Attacker has capability for DNS spoofing in external network (DNS cache poisoning)
2. Attacker should have cert which is not self-signed
  - we use goorm hosting service for certificate which issued from root CA
  - (real attackers prepare their site with root CA and IP)
  - But It works with container, cannot access directly remote server in ours container with URL or IP
  - So verifying server spoofing, we test with URL modification in code like below,

```

29 //const host = "https://team-server-dhzve.run.goorm.io";
30 const host = "https://con-t-ythyc.run.goorm.id";

```

(below is attacker's)

- ⇒ Assume that DNS spoofing is applied for team3's server URL by modifying URL in source code

### Procedure:

1. make fake server with python flask and run in goorm hosting service
2. connect localhost:3000 and try to login
3. server is spoofed
4. check if user credential is received or not in attacker's server
5. check if ALPR service doses not worked well

### faker server's impl - signin method : sniffing user credential

```

https.py index.py form_action.html
...
14
15     @app.route('/')
16     def hello():
17         return render_template('hello.html')
18
19     @app.route('/signin', methods=['GET','POST'])
20     def signin():
21         app.logger.error('signin')
22         if request.method == 'GET':
23             form_user = request.args.get("username")
24             form_pass = request.args.get("password")
25             form_otp = request.args.get("otp")
26         else:
27             form_user = request.form.get("username")
28             form_pass = request.form.get("password")
29             form_otp = request.form.get("otp")
30
31             print(form_user)

```

without processing signin, we just sniffing  
http get method and user credential is passed

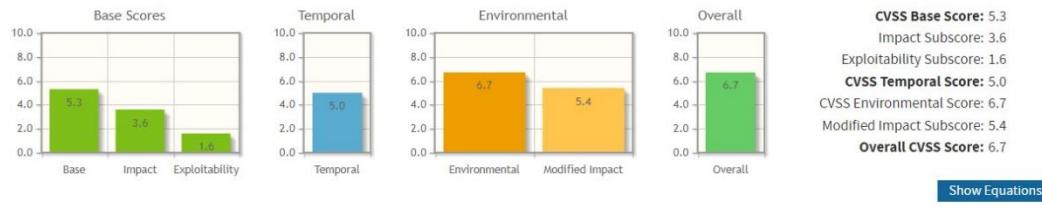

### 4.2.25 V23 - phishing client web site

Table 84 Vulnerability - V23

Description	[V23] phishing client web site		
CIA	[Availability] [Confidentiality]	Attack vector	[CLIENT/PRIVILEGED]
Approach	[REVIEW/DESIGN]	Exploit technique	[SPOOFING]
Vulnerabilities			
<ol style="list-style-type: none"> <li>S/W structurally, on client side, there are UI app and local host server and there is no any authentication of client webapp. It means that there isn't any protection on client.</li> <li>Attacker can spoof client UI web for phishing and steal sensitive data or prevent officer executing law enforcement.</li> </ol>			
CVSS Score	6.7	Severity	Medium

## Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

Show Equations

AV:N/AC:H/PR:L/UI:N/S:U/C:H/I:N/A:N/E:P/RL:X/R:C:/CR:H/IR:L/AR:L/MAV:N/MAC:H/MPR:L/MUI:N/MS:U/MC:H/MI:N/MA:N

### Consequence / Impact analysis

Phishing client can occur stealing sensitive data (e.g. user credential) and it is sold to illegal group for making money or used for following attack. Secondly, officer cannot execute law enforcement. In other words, officer connect to fake client, try to login, start ALPR service. Everything is worked well visually. But fake client does not send any license plate data to server. So, ALPR service is not worked normally.

### Recommended mitigation

Run client webapp in server side or apply authentication procedure with web server

Tools needed	socat(for port forwarding), yarn(running webapp)
--------------	--

### Relative component / source code

Client UI Webapp (design problem)

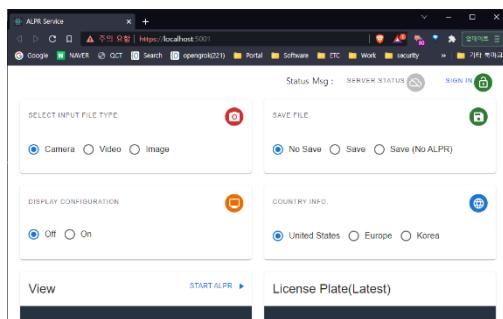

### Proof of concept / How to attack

Constraints:

- client PC has received any malware which attacker injects for forwarding port and running attacker's fake webapp

Procedure:

1. Make fake client webapp and run with port 5001 like below

2. modify login button function

(print console log → It can be changed to other method to transfer user credential)

```

31 otp: Yup
32   .number()
33   .required(
34     'OTP is required'
35   ),
36   onsubmit: (values) => {
37     const formData = new URLSearchParams();
38     formData.append("email", values.email);
39     formData.append("password", values.password);
40     formData.append("otp", values.otp);
41
42     console.log("email:" + values.email);
43     console.log("password:" + values.password);
44     console.log("otp:" + values.otp);
45   }
46 };

```

3. apply port forwarding 3000 → 5001 with socat

insert command like below, it forward 3000 port to 5001

```
> socat tcp-listen:3000,reuseaddr,fork tcp:127.0.0.1:5001
```

```
PS C:\Users\kUser\Downloads#socat-1.7.3.2-1-x86_64#socat-1.7.3.2-1-x86_64> ./socat tcp-listen:3000,reuseaddr,fork tcp:127.0.0.1:5001
2022/07/08 17:10:39 socat[24704] E write(6, 0x600042e50, 24): Broken pipe
```

4. officer connect to localhost:3000(ALPR web service UI URI)

5. It redirects the site to localhost:5001, officer sees the same graphical web page, but it is attacker's phishing site!

6. User attempts to login, then attacker could get user credential

```

ALPR service
Sign in
Email Address: test@gmail.com
Password: *****
OTP: *****

SIGN IN NOW

31 otp: Yup
32   .number()
33   .required(
34     'OTP is required'
35   ),
36   onsubmit: (values) => {
37     const formData = new URLSearchParams();
38     formData.append("email", values.email);
39     formData.append("password", values.password);
40     formData.append("otp", values.otp);
41
42     console.log("email:" + values.email);
43     console.log("password:" + values.password);
44     console.log("otp:" + values.otp);
45   }
46 };

```

Although the officer connects to the localhost:3000, he connects to the attacker's site (localhost:5001). and his credential is stolen by attacker. And finally, he does not execute law enforcement because client is fake site

#### 4.2.26 V24 - Stolen token, spoofing as valid user, sensitive information could be sniffed

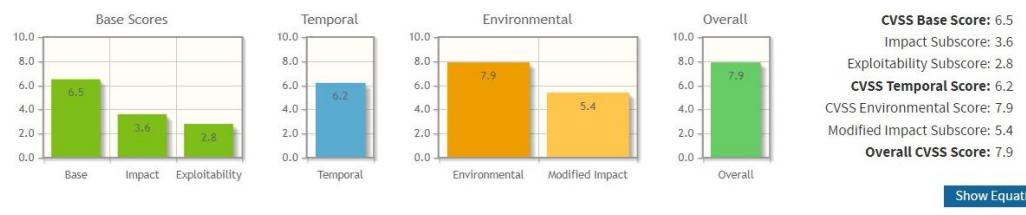

Table 85 Vulnerability - V24

Description	[V24] Stolen token, spoofing as valid user, sensitive information could be sniffed		
CIA	[CONFIDENTIALITY]	Attack vector	[NETWORK]

Approach	[REVIEW/CODE] [REVIEW/DESIGN]	Exploit technique	[SNIFFING]
<b>Vulnerabilities</b>			
Stolen token, spoofing as valid user, sensitive information could be sniffed			
Relative component / source code			
CVSS Score	7.9	Severity	High

### Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

AV:N/AC:L/PR:N/UI:R/S:U/C:H/I:N/A:N/E:P/RL:X/RC:C/CR:H/IR:L/AR:L/MAC:L/MPR:N/MUI:R/MS:U/MC:H/MI:N/MA:N

### Consequence / Impact analysis

An attacker can steal general user credentials such as user name, password, otp seed, token

and use this credentials to acquire the plate information

### Recommended mitigation

Provide the client interface in the form of WebApp.

So, Eliminate exposed IPC channels by operating in one process.

Tools needed	Wireshark
--------------	-----------

### Proof of concept / How to attack

1. packet capture start with localhost
2. connect webpage to https://localhost:3000/
3. proceed login
4. check token in wireshark packet
5. Insert token to header, could be impersonate as validated

The screenshot shows a POST request to `https://team-server-dhavir.un giornio.it/state/getPlateNumber=GRNO422`. The Authorization header contains a token: `eyJhbGciOiJIUzI1NiJ9.eyJzdWIiOiJhZG1pbi5nb25lLmNvbSIsImlhdCI6MTYxOTMwODQyOSwiZXhwIjoxNjA5MzQ4MDI4fQ.sVgkDzwhwvBQDwTAINTUQ2d6cWpKQD2oqy9t9r9e4Ezsd9Pn9oc029Z9yAhs`.

The response body is a JSON object:

```

1 [ { "result": { 2 "address1": "664 Ramo Point Apt. 211", 3 "address2": "Worrellsmouth, Oh 88999", 4 "city": "Worrell", 5 "state": "OH", 6 "zip": "88999", 7 "expiration_date": "2023/08/2024", 8 "watch_list": "best", 9 "name": "Mark Newton", 10 "nick": "mark", 11 "status": "No Warts / Warrants", 12 "vehicle_color": "navy", 13 "vehicle_model": "Fiesta", 14 "vehicle_year": "2016" 15 } 16 }
  
```

#### 4.2.27 V25 - The external server provided by goorm does not support mutual authentication using tls based on pki.

Table 86 Vulnerability - V25

Description	[V25] The external server provided by goorm does not support mutual authentication using tls based on pki.																		
CIA	[CONFIDENTIALITY] [INTEGRITY]	Attack vector	[NETWORK]																
Approach	[REVIEW/CODE]	Exploit technique	[SNIFFING]																
Vulnerabilities																			
server.py  - does not implement mutual authentication using tls based on pki.																			
<pre>app = Flask(__name__)  if __name__ == '__main__':     app = Flask(__name__)     app.config['DEBUG'] = True     app.config['SQLALCHEMY_DATABASE_URI'] = config._DB_PATH_     app.config["SECRET_KEY"] = config._SESSION_SECRET_KEY_      db.init_app(app)     if not os.path.isfile('./server.db'):         with app.app_context():             db.create_all()             createdb()      app.register_blueprint(usermanagement.user_management)     app.register_blueprint(platequery.plate_query)      app.run(host='0.0.0.0', port=80)</pre>																			
Relative component / source code																			
CVSS Score	9.3	Severity	Critical																
<b>Common Vulnerability Scoring System Calculator</b> <p>This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. ### 4.2.28 V26 - Available to change https to http by tempering the client's server.js file.

**Table 87 Vulnerability - V26**

Description	[V26] Available to change https to http by tempering the client's server.js file. because mutual authentication with an external server is not performed.		
CIA	[CONFIDENTIALITY] [INTEGRITY]	Attack vector	[CLIENT/SOURCE]
Approach	[REVIEW/CODE]	Exploit technique	[TAMPERING]
Vulnerabilities			
Available to change https to http by tempering the client's server.js file. because mutual authentication with an external server is not performed.			
Relative component / source code			
CVSS Score	7.6	Severity	High

## Common Vulnerability Scoring System Calculator

This page shows the components of the CVSS score for example and allows you to refine the CVSS base score. Please read the CVSS standards guide to fully understand how to score CVSS vulnerabilities and to interpret CVSS scores. The scores are computed in sequence such that the Base Score is used to calculate the Temporal Score and the Temporal Score is used to calculate the Environmental Score.

AV:N/A:C:L/PR:L/UI:R/S:U/C:H/I:H/A:N/E:P/RL:X/RC:C/CR:H/IR:H/AR:L/MAV:N/MAC:L/MPR:L/MUI:R/MS:U/MC:H/MI:H/MA:N

### Consequence / Impact analysis

An attacker can sniff all information by changing HTTPS to HTTP by tampering with the internal server of the client app.

And using its information, an attacker can acquire the plate information.

### Recommended mitigation

#### Using the PKI with SSL/TLS

Tools needed	Wireshark
--------------	-----------

### Proof of concept / How to attack

```
server.js

: tempering code

- const https = require('https');

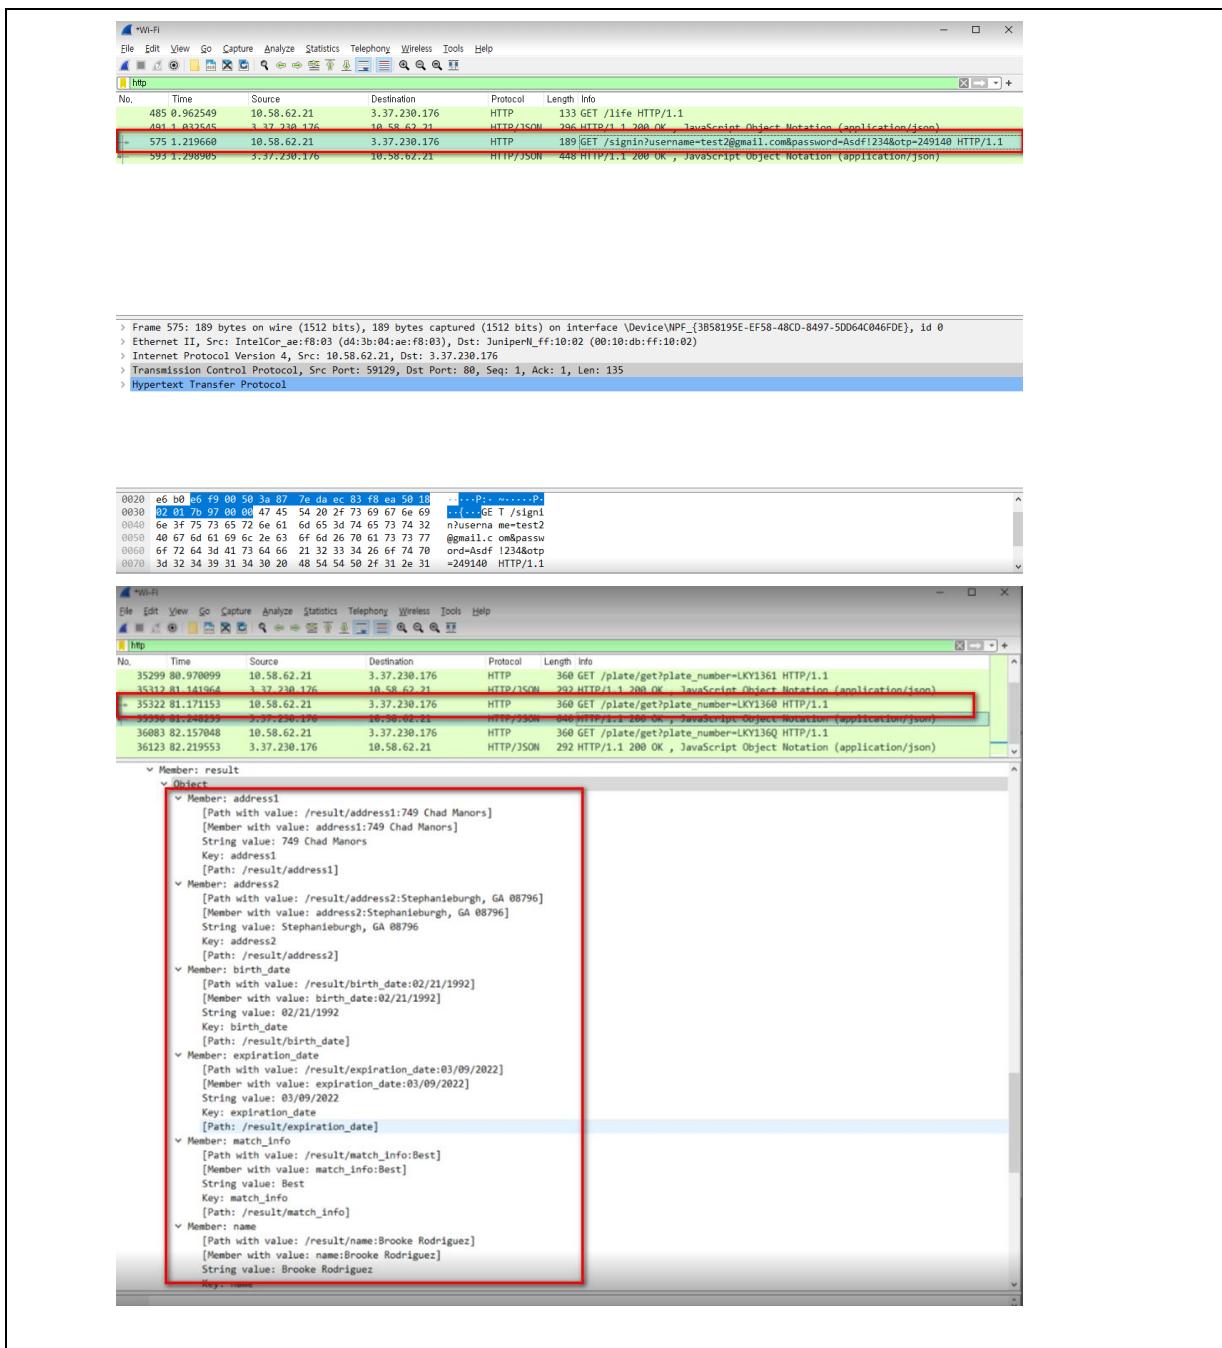

- const host = http://team-server-dhzve.run.goorm.io;

  1:  const path = require('path');
  2:  const https = require('https');
  3:  const http = require('http');
  4:
  5:  const sslConfig = require('./ssl-config');
  6:
  7:  const options = {
  8:    key: sslConfig.privatekey,
  9:    cert: sslConfig.certificate
 10:   };
 11:
 12:  // const server = https.createServer(options, app);
 13:  const server = http.createServer(app);
 14:  const cors = require('cors');
 15:  const io = require('socket.io')(server, {
 16:    cors: {
 17:      origin: "*",
 18:      credentials: true
 19:    }
 20:  });
 21:
 22:  app.use(cors());
 23:  app.use(express.urlencoded({
 24:    extended: true
 25: }));
 26:
 27:  const host = 'http://team-server-dhzve.run.goorm.io';

 28:  var socketId = "";
 29:  io.on('connection', socket => {
 30:
 31:
```

Communication with an external server has been changed to http.

Requests and responses are made to plain text, and all information is exposed.

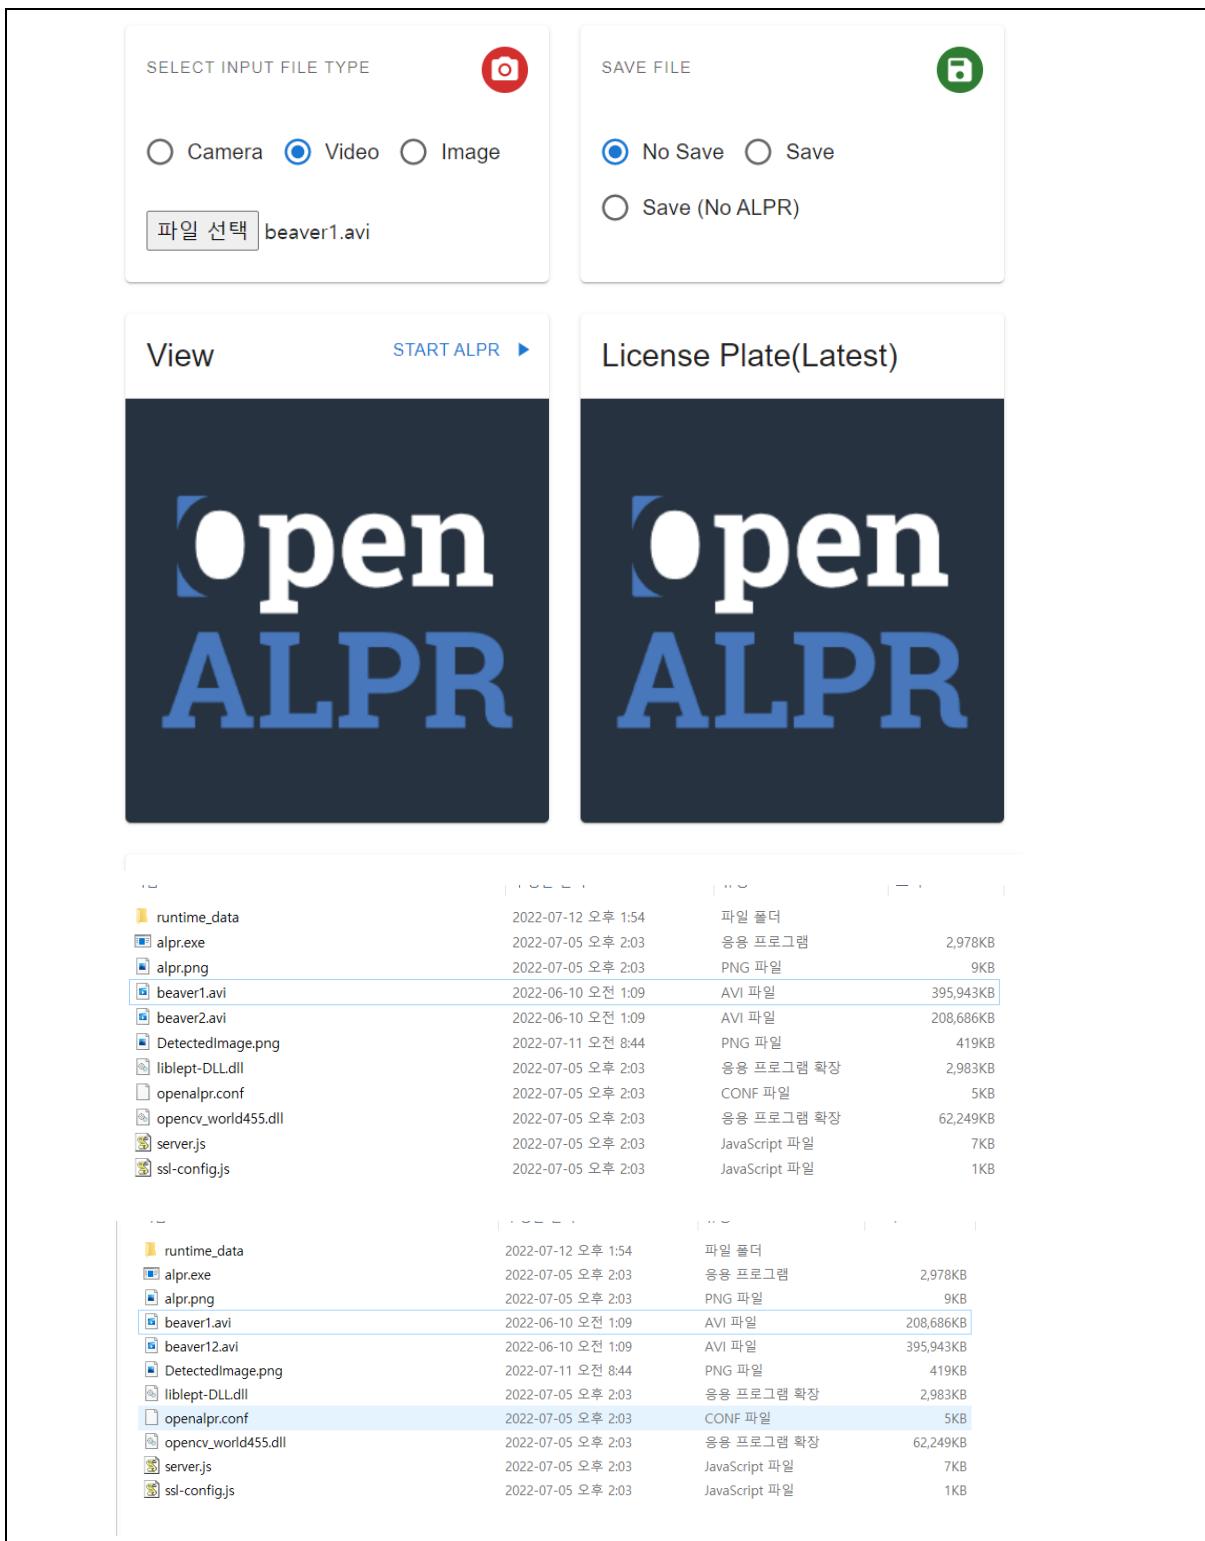

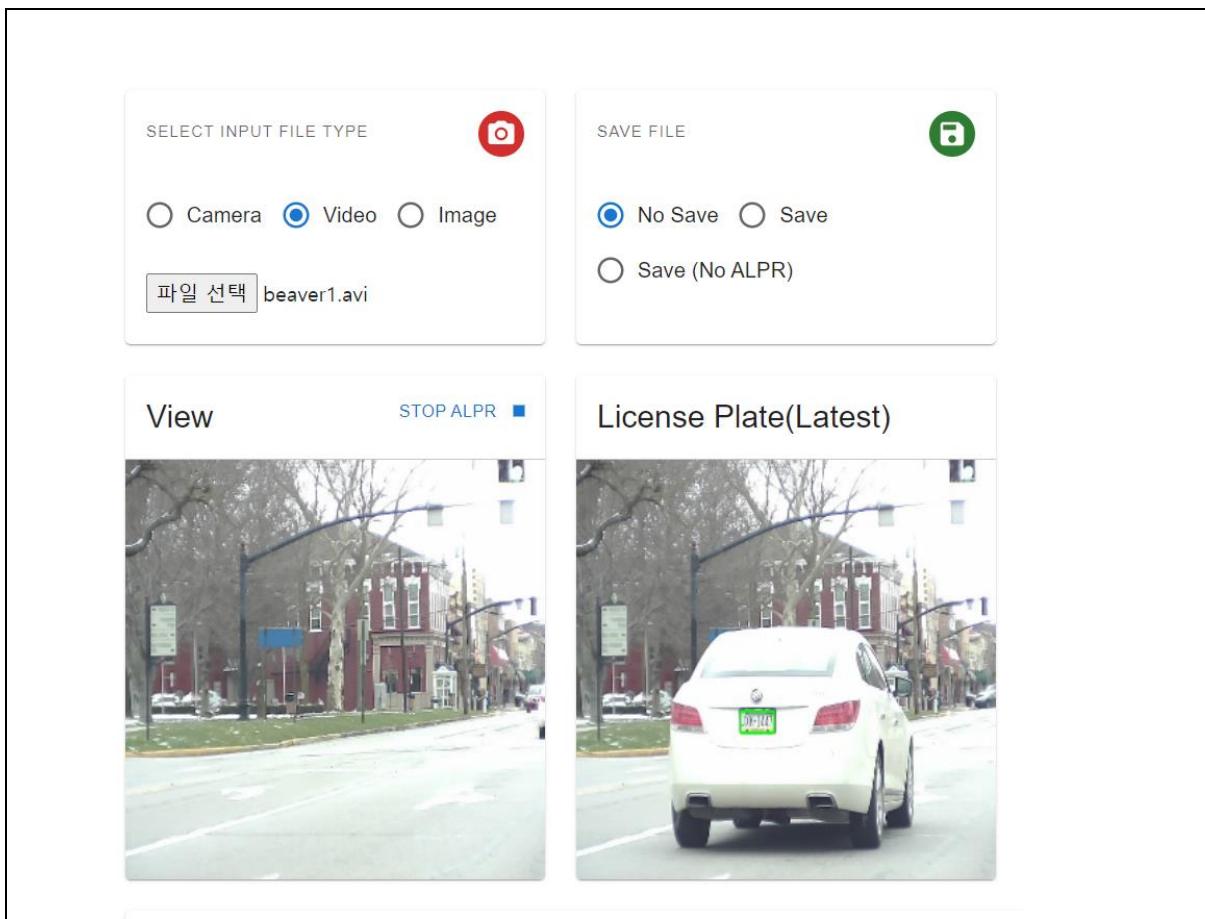

#### 4.2.29 V27 - A TOCTOU attack is possible because there is a time gap between file selection and file playback.

## 5 Lessons Learned

---

### 5.1 Lesson #1

- ✓ Thinking like an attacker!
  
- ✓ Not all vulnerabilities can be eliminated. However, it should be possible to remove as much as possible at each stage of the SDL cycle.
  
- ✓ Security issues also arise where there is no direct relationship with the security requirements. It seems to occur mainly in weak design, implementation, and the interface between modules.
  
- ✓ Software requirement is easily implemented with COTS, opensource and so on. But without deep consideration about threat analysis, security requirement and design, It can occur tremendous vulnerabilities

- ✓ By finding vulnerabilities in target software, we could find hidden security issue and mitigation reversely

## 5.2 Learned methodologies, techniques and tools

- ✓ Threat modeling using STRIDE → To identify and eliminate potential vulnerabilities
- ✓ Understanding into the most common security risks so that we could use the findings of the report as part of our class-mates security practices Using OWASP
- ✓ How much using code-review and utilizing some tools is important
- ✓ Utilize wireshark, Chrome inspector and a few types of static analysis tools
